The arson and violence continued till late in the night and the shops continued to burn till the morning of the 11th. The district administration was able to bring the situation under control only by then although the curfew had been imposed the previous night. On May 11, the district authorities asked the VC to close down the University. The VC according to reports, was reluctant, but was finally persuaded to do so. The University was announced closed till June 1, and subsequently till July 2. Special buses and trains with police escort were arranged to take the students out of Aligarh to their homes.

The events of May 10 clearly show that there was no attempt by the district administration and the University authorities to prevent the situation from deteriorating. The top Students' Union leaders were absent from the scene when communal passions were being worked up. All the three parties seemed to have acted with the positive intention of letting the events drift inevitably to communal violence. The Chief Minister has given varying statements on the incident based purely on political expediency, with an utter lack of concern for the people involved.

As reaction to the AMU incidents, a series of posters and slogans have appeared in the city. One poster issued by the local unit of the Janata Yuva Morcha is entitled 'An Emotional Appeal' and is addressed to the parents of the Hindu students of the AMU requesting them to notify telegraphically the absence, if any, of their sons/daughters. This is a deliberate attempt to increase tension. In answer to the poster 'Zulm Kab Tak? Grant minority status to AMU, Otherwise....', 'Do not grant minority status to AMU, Otherwise....' have appeared. Slogans demanding the nationalisation of the AMU and affiliation of the local colleges to AMU as well as some very provocative slogans like 'Where are the Pakistanis—they are in AMU' are to be seen on the walls of the DS College and nearby areas. The 'Udyog and Vyapar Mandal' of Aligarh called for an Aligarh Bandh on May 21 to protest against the attacks on the Hindus and their shops in the University area. Fortunately for the inhabitants of the city the bandh passed off peacefully. Reports have also appeared in the local newspapers of the formation separately of an organisation of the Hindu staff of the AMU with the proclaimed objective of ensuring the safety and the interests of Hindus in the AMU.

While the political parties of various hues and colour are busy trying to make political capital out of the incidents, the situation in Aligarh continues to be tense. And it is doubtful whether Aligarh will ever be free from communal tension so long as these parties continue to dominate Indian politics.

RELIGION

The Bohras: Bound by Terror

Asghar Ali Engineer

THE Bohras, a Shia Ismaili Muslim sect, are a petty business community numbering around a million and living in India as well as abroad. They are as a rule conservative in their outlook and submissive to authority—religious or political. The religious head of the Bohras—the Syedna—has taken full advantage of this conservatism and submissiveness to establish what is virtually a personal religious empire'.

At the turn of the century some Bohras who had acquired Western education challenged the authority of the 51st Dai (the father of the present incumbent who happens to be 52nd in the chain of this non-hereditary religious office). While they acknowledged his religious headship they desputed his claim to complete control over every other aspect of their lives. The Syedna retaliated by ex-communicating them. The Bohra masses by and large followed Syedna's firman. Many law suits were successfully filed in this connection by the reformists in the British courts. But their legal victory did not sway the Bohra masses with whom they could not remain in contact due to their ex-communication, and the Syedna was able to convert his legal defeats into victories with the help of his phenomenal wealth. This cry of 'religion in danger' too stood him in good stead.

What are the issues at stake? The reformists plead that they should be free to enjoy democratic and human rights as guaranteed by the country's Constitution. Today a Bohra cannot even vote freely or contest in an election without prior approval of the priestly establishment. The Bohras of Udaipur led by the Bohra Youth Association had to pay dearly for their defiance of the priestly injunction not to vote for certain candidates in the local municipal elections in 1970. Likewise the Bohras cannot marry or start a charitable organisation without the Syedna's permission. They are forbidden to read newspaper and periodicals censored by the Syedna. All that the reformists want is an end to such totalitarian control over the Bohras' lives which cannot be supported by any religious injunctions whatever their interpretation.

The Nathwani Commission set up by the citizens for Democracy following two resolutions by the CFD national executive in August and October, 1977, has in its report released last month found that "there is large scale infringement of civil liberties and human rights of reformist Boharas

at the hands of the priestly class and those who fail to obey the orders of the Syedna and his amils, even in purely secular matters are subjected to *baraat* (social boycott) resulting in complete social boycott, mental torture and frequent physical assault".

The five-member Commission investigated many complaints of atrocities and found them to be true. One witness (Memunabia daughter of Rajabali Bagpurawala from Udaipur) told the Commission: "My brother was breathing his last. My sister Shirin who is married to one who is the supporter of the orthodox section wanted to see her brother's face for the last time and so rushed down to our place. The result was that her husband, at the instance of the priesthood, prevented her from returning to her home. He told her that by going to the residence of our father who was a reformer she had polluted herself. In this way she was prevented to return to her home for six months and after compelling her to express repentence and to give *misaq* again (the oath of unquestionable obedience to the head priest), she was allowed to return. Since then I have not been able to see her face. She is not allowed even to pass by our house. In 1976 when my sister Sakina was married, Shirin was not allowed to attend the marriage."

Another case recorded by the Commission brings out in horrifying detail the way dissenting members of the community (although their dissent is restricted to secular matters) are persecuted. The case was narrated by Mohamad Sajjad Hussain Sarangpurwala. Sheikh Sajjad Hussain, father of Mohamad Sajjad Hussain, was an eminent teacher in an Arabic College in Surat run by the Bohra priestly establishment. Sheikh Sajjad Hussain, along with other three teachers of the same college, was suspected of secretly supporting the reformist cause. All the four teachers were dismissed from the college. The Bohra high priest declared *baraat* against all the four teachers. He started referring to them as *maloon* (hated creatures or Satan) and informed his followers everywhere accordingly through a circular. He called the family members of the four teachers to his place and told them either to expel the four persons from their respective families or to leave them collectively and curse them. When they refused to do so, they were manhandled by the followers of the Syedna and *baraat* was declared against the family members also, resulting in their intolerable isolation from their community. Mohamad Sajjad Hussain's wife was forced to divorce him. His four month old daughter was declared *harami* (bastard). Similarly the son-in-law of Shaikh Hassan Ali (another teacher) was forced to divorce his wife; and as he was serving in the Syedna's establishment, he had to carry out the order even though he was deeply attached to his wife. The witness also stated that all the four teachers were called before the Syedna and in his presence other teachers and pupils of the Arabic College were asked to curse them, spit on them and abuse them. On the same night (January 1, 1971) a mob of about 300 persons attacked their houses and looted household properties and books of religion. At that time Shaikh Hasan Ali (one of the four teachers) was called out and severely beaten by his own pupils. The persecution went on uninterrupted over the years. On the night of November 22, 1974 Mohamad Sajjad Hussain's house in Surat was surrounded and the members of the family were severely assaulted by a frenzied mob consisting of the teachers and pupils of the Surat Arabic college. Sheikh Sajjad Hussain, the witness's father, was so severely assaulted that he succumbed to his injuries in the hospital.

The Syedna and his henchmen have not spared even women. Mehfooza Abid Hussain Adib of Udaipur, aged about thirty, whose husband is a reformer, narrated the harrowing tale of the collective assault upon her and other women who supported reformist cause at Galiakot on February 28, 1973, where they had gone on the occasion of an *urs*. She was confronted there, accused of being an enemy of the Syedna and was asked to condemn her husband who was described as a *kafir*. When she refused to do so, she was hit on her head with a lathi. "I felt giddy. After sometime when I regained consciousness I saw that some persons were casting lustful eyes upon me. They also abused me. My outward garment was torn. In this state I had to run upto the market from that place. Some persons were still pursuing me With great difficulty I could hide myself in a house." Mehfooza Abid Hussain Adib said that other women who supported reformist cause were similarly assaulted in the very presence of the Syedna. When they pleaded for mercy, the high priest remained unmoved and kept on smiling. "That black day can never be erased from our memory, as long as we live." These are but a few of the large number of instances of persecution and physical assaults recorded by the Commission.

A most reprehensible practice of the Syedna is his use of *misaq* (oath of allegiance) as an instrument of slavery. The Commission has observed: "The implication of this oath is clear. It is that a promise of absolute obedience to all the future commands of the Dai, whatever they are, and whatever be their subject matter, is a condition of being a Dawoodi Bohra. One has to accept the Dai not merely as a religious head but as a master in secular affairs as well. This puts the Dai in the position of an absolute dictator controlling all the aspects of the life of all members of the community. Even God is not above the Dai, because the oath says that if Dai's orders are broken even God will not pardon the person who has disobeyed the Dai's orders. And what is the sanction for breach of the covenant? Not merely the fear of hell and torture in the next life but complete ostracism and pauperisation in this life as well. The offender's property should be looted and his nearest relations should break away from him. He stands automatically divorced from his wife.

Thus complete surrender to the Dai even in secular matters is the price one has to pay for becoming a Dawoodi Bohra. The *misaq* in the form in which it is being administered since the time of 51st Dai implies that only a slave, not of God but of the Dai, can be a true Dawoodi Bohra. It is difficult to say how the human being with any sense of self-respect can take such an oath or having taken it when he was a minor can ever think of respecting it. If he stands fully by this kind of oath, he would be placed in a position of an offender not only against the laws of the State but also against the law of God. He cannot criticise the Dai in public or in private. He cannot read the books or magazines which are indexed by the Syedna. He cannot maintain any intercourse with those on whom the Syedna's wrath has descended. He must participate in the looting of the property of a disobedient person if asked to do so. He must join in the war against the enemies of the Dai if commanded by him to do so. In short he should do whatever is commanded and should not do what is forbidden by the Dai. He has to mortgage the rest of his life to the Dai in choosing whom he had to voice.

In view of all this the Commission feels that suitable legislation should be passed to relieve hardships of the community. The Commission has recommended that *baraat* or social boycott so frequently resorted to by the high priest should be made illegal and penalised as an offence. Secondly *misaq* should be limited to obeying of the Syedna's directions only in religious matters. If the Syedna refuses to do so, then the giving of *misaq* in its present form should be prohibited by law. Thirdly, in all the trusts where the Syedna claims to be the sole trustee, and the receipt and expenditure of all the customary taxes and *nazranas* should be regulated by suitable legislation. Acts like Wakf Act of 1954 and the Durgah Khawaji Saheb Act of 1955 show that such legislation is constitutionally valid. Since many of the trusts receive income from different parts of India and abroad, and since the customary taxes and *nazranas* are also collected in India and other parts of the world, regulation for the collection of such trusts and income should be the responsi-

bility of Parliament rather than that of any state legislature.

It should be noted that the Syedna is extremely wealthy and his money controls many politicians, especially from among the Muslims. Many Congress politicians have been beholden to the Syedna who, they believe, controls Bohra votes. The Commission itself has revealed that the Syedna has been, from time to time, ordering his followers to vote for the Congress party candidates in various elections. Naturally, now that the Congress is no more in power, the Syedna is busy building bridges with the Janata party.

The powerful vested interests among Muslims are ever ready to cry wolf about assaults upon 'minority rights'; and the anxiety to ensure the Muslim vote makes the ruling party reluctant to initiate, or even support, moves made by enlightened sections among Muslims themselves for purposeful social legislation in the interest of suffering Muslims. It is therefore, difficult to say whether the modest recommendations made by the Nathwani Commission which did not in any way violate the spirit of the Constitution in so far as the minority rights are concerned, would be implemented by the Janata government. The liberal and the enlightened sections of the Muslims have wholeheartedly supported the cause of reform in the Bohra community, and many Muslim writers, intellectuals and teachers, belonging to the Aligarh Muslim University, Jamia Millia Islamia, Jawaharlal Nehru University, Delhi University, etc, have urged the government to implement the recommendations of the Nathwani Commission. Will the government show enough courage to end this reign of terror in the Bohra community?

PAKISTAN

Islamisation of an Islamic Republic

ON February 10, 1979 (12 *Rabi ul-Awwal* the birthday of Prophet Mohammad) Pakistan's Chief Martial Law Administrator and President, General Zia-ul-Haq, announced the much-heralded Islamisation measures. The measures deal broadly with taxation and deterrent punishments for various crimes. Such measures to 'Islamicise' the Islamic Republic of Pakistan were necessary to justify the regime's existence. By making the present regime synonymous with Islam, its leaders hope to make any criticism of the regime appear 'unislamic'.

Prior to this, the military government had already taken a few steps (each time with a great deal of fanfare) towards Islamisation. These consisted of revision of text books, switchover of the medium of instruction from English to Urdu in schools, changes in radio and TV programmes to spotlight national identity, establishment of *shariat* benches for reframing laws according to the tenets of Islam and setting up of a post-graduate faculty of *shariat* at Islamabad University to produce experts with a thorough grounding in Islamic jurisprudence and *shariat*.

While announcing the formal enforcement of *shariat* laws, Zia painted a picture of a heretic and degenerate Pakistan where the new generation was not acquainted with the ideology of Pakistan and where people were pursuing materialism. It was not easy, he said, to "reform a degenerate society" and it required "courage, time and continuous struggle" to do so. He then went on to say that the important objective of an interest-free Islamic economic system could not be achieved immediately; such system could only be introduced in stages and would take upto three years to complete. *Zakat* and *Ushr* were being introduced "to begin with".

On closer examination of the two types of law introduced—the welfare-oriented and the punitive—one finds that the welfare measures, through the collection of *Zakat* and *Ushr*, are actually another way of earning more money for the treasury. *Zakat* (tax on wealth) and *Ushr* (tax on agricultural produce) are to be in addition to the existing taxes. Both are supposed to be 'voluntary' contributions, to be deposited on the basis of self-assessment in accounts opened specially for this purpose, at local, provincial or central level. At the same time, a part of *Zakat/Ushr* has been made mandatory, showing government's skepticism regarding such voluntarism. From July 1, *Zakat* is to be levied at the rate of 2.5 per cent on amounts over Rs 1,000 held in all accounts (except current accounts) in banks and financial institutions. The measure has already frightened depositors who are not only desisting from putting in money but have also withdrawn large sums from banks to avoid this additional tax burden.

Ushr, the tax on agricultural produce, shall be payable at the rate of 10 per cent on produce from *barani* (rain-fed) lands and at 5 per cent on produce from canal and well-irrigated lands. A point to be noted about *Ushr* is that no distinction has been made between the landowner and the tenant farmers. In fact, with the existing relations between landlords and tenants there is all likelihood of the tax being shifted to the tenant.

The proclaimed objective of *Zakat* and *Ushr* is the alleviation of the needy and poor. The success of the programme will depend on the administration and utilisation of funds for which elected local committees of 'god-fearing and pious' persons are envisaged. With the tradition in Pakistan of a system of patronage emerging around any person in a position of authority and power, the nature of the one due to emerge around the local committees of 'god-fearing and pious' can be easily imagined. An additional problem may be the provision for linking local body structure with the utilisation of *Zakat* funds after the local bodies elections which Zia-ul-Haq wants to hold before national elections. At the provincial and central level *Zakat* councils are to have as members the *ulema*. The judiciary too is being wooed, with retired judges expected to be chairman of these councils.

The punitive measures of the Islamic order were promulgated through four presidential orders. Under Islamic law the extreme limit of punishment is called *hadd*. The four *hadoods* (limits) are drinking, adultery, theft and false allegation. The punishments are certainly very primitive and barbarous—cutting of hands and feet for theft, stoning to death for adultery, upto hundred lashes and stripes for various crimes ranging from drinking to *qazf* (false allegation of adultery). There are detailed specifications regarding the whip to be used for administering lashes—one single piece made of leather, cane, or branch of tree having no knob or joint, having a maximum length of 1.22 metre and a maximum thickness of 1.25 cm.

There have also been quite learned debates about the actual interpretation of these provisions. The Shia sect of Muslims, for instance, do not agree that the punishment for theft should be amputation of the right hand from the wrist. According to them only the fingers are to be amputated. The question of returning the severed hand to its owner and the possibility of it being grafted back has also been raised. Similar differences on interpretation are expected from the Barelvi, Deobandi and the Ahl-Hadees schools of thought on different aspects of Islamic laws.

Women have reason to be perturbed over the enforcement of these Islamic laws. What they fear is the repeal of the Family Laws Ordinance—a relatively progressive legislation—which gives women some protection through the right to divorce and the right to receive payment for maintenance of children in a broken marriage. The ordinance also curtails the right of the Muslim male to have

four wives. The woman's fears are certainly not unfounded, for the Family Laws Ordinance is under review. The new measures further emphasise the women's inferior status through provisions like the one which makes the evidence of female witnesses unacceptable in courts of law.

Perhaps the intention of these 'Islamic' measures is not to reform the present legal system but only give the appearance of doing so. So far hardly any case has been admitted under Islamic law. Had the military regime been really serious about the implementation of Islamic laws, it would have tried Zulfikar Ali Bhutto under them; and under Islamic law pertaining to murder, which requires eyewitnesses to testify against an accused, which does not take complicity into consideration, and which has a provision for payment of blood money as compensation for life taken, Bhutto could never have been convicted and hanged.

WEST GERMANY

Pipe-Dreams of Reunification

Ramesh Jaura

WEST GERMANY celebrated on May 23 the thirtieth anniversary of the enactment of 'basic law', amidst a strong controversy raging on the prospects of German reunification. The issue is indeed of far-reaching significance and closely connected with the basic law, initially intended to be a provisional constitution.

Four years after the collapse of the Third Reich and the unconditional surrender of Germany, representatives from the occupation zones of the three Western powers—the US, UK and France—laid down fundamental rules for the structure and development of what came to be known as the Federal Republic of Germany. Because of the division of Germany, they decided to call this set of rules not 'constitution', but 'basic law'.

The preamble to the basic law stated that the German people in Western occupied zone had "also acted on behalf of the Germans to whom participation was denied". Further, it called upon "the entire German people to achieve in free self-determination the unity and freedom of Germany".

The new-born West German state ruled by the conservative Christian Democratic Union (CDU) and its Bavarian counterpart, Christian Social Union (CSU), left no doubt that it regarded itself the sole representative of the German people, including those in the German Democratic Republic. This view was backed by Paris, London and Washington—at least in statements.

To reinforce this assertion, Bonn evolved the "Hallstein doctrine" according to which any country establishing diplomatic relations with the GDR had to count with diplomatic rupture with FRG. Yugoslavia's decision to recognise the GDR in 1958 led to snapping of ties with West Germany. Seven years later, the Hallstein doctrine combined with Bonn's relations with Israel led ten Arab states to sever relations with FRG. However, the doctrine was not enforced when Konrad Adenauer established diplomatic relations with Moscow in 1955.

Adenauer charged "atheist Bolshevism" of the Soviet Union with both hindering the path of reunification and menacing the free world order. But the chancellor and his party, the CDU-CSU, knew very well that FRG was the result of Hitler's senseless war; that it was a creation of allied policy; and that the Soviet Union held the key to German reunification. These three points, still valid, are crucial to any debate on the issue.

But there are also other road-blocks to German unity. The growing economic, political and military strength of West Germany is already a cause of concern to its allies in the West and neighbours in the East, despite the fact that Bonn has repeatedly sought to assure that it has no great power ambitions. Besides, the 1973 comprehensive Treaty on the basis of relations between the FRG and GDR and bilateral agreements with the Soviet Union and other East Europen countries oblige Bonn to recognise the present state boundaries in Europe. Of course, Bonn has nowhere in these treaties budged in on its stand on one German nation. But then the concept of one nation based on linguistic foundation is highly questionable.

Just as the Hallstein doctrine has had to be abandoned at the end of the 1960s, the dictates of realpolitik have forced the leading political parties in West Germany to regard unification as a distant goal which may or may not be achieved. In the view of official Bonn, European unity, encompassing the whole of Europe and not just West Europe, should provide the broad framework for German reunification. Despite the forth-coming elections to European parliament even West European unity is hardly within reach.

In this context, views expressed on the issue of reunification of Germany by eminent West German leaders are significant. SPD parliamentary party leader Herbert Wehner, Willy Brandt and liberal FDP veteran Borm have described the 'unity of Fatherland' as an 'illusion' which needs be discarded soon. A West German diplomat in Berne has gone even further in calling for an amendment to the basic law and dropping the very reference to German unity.

Foreign Minister Genscher however disagrees. The task assigned by the constitution, says Genscher, must be achieved with patience and by peaceful means. In his recent report to parliament on the State of the Nation, Chancellor Helmut Schmidt has reaffirmed that the *goal of unity, within the framework of* European peace, is "the consummation of our liberal democracy".

It was not, however, the issue of German reunification which attracted world-wide attention on the occasion of the 30th anniversary of basic law, but the election of Karl Carstens, an 'ex-Nazi' as president of West Germany. Karl Carstens, the CDU-CSU opposition nominee, was elected to this largely ceremonial post on the very day of the anniversary of the basic law.

Carstens' nomination itself was surrounded by a strong controversy about his war-time membership of the NSDAP.

According to the CDU-CSU Opposition of which he was the nominee, Carstens was forced to join the Nazi party and in any case his membership was nominal, as he went to the army. After the war, he was cleared of active Nazi involvement by a tribunal. In the post-war period, Carstens proved his credentials as a democrat, first as a representative of the Bremen city government in Bonn and later as a state secretary to the foreign office, defence ministry and the chancellor's office. Besides, even the outgoing president Walter Scheel was a member of the Nazi party and served as a fighter pilot in Hitler's airforce. Like Carstens, Scheel was also cleared by a post-war tribunal. Even Chancellor Helmut Schmidt was a Hitler youth leader.

If the opposition had not insisted on putting up a nominee of their own, Walter Scheel would have remained in the job. Described as "unquestionably the most popular president in the three decades of the West German state", opinion polls revealed that 80 per cent of the population would have liked Scheel to continue as the president. But in view of the opposition commanding an absolute majority in the federal assembly electing the president, Scheel did not want to contest.

The debate about the presidency has led to mounting demands for choosing the president through popular vote. Supporters of the proposal say that democracy is now sufficiently deep rooted to make the change. The electoral system for the presidency was chosen to avoid the kind of pitfalls that marked Germany's last venture in democracy, the Weimar Republic, in the aftermath of World War I, which actually enbaled Hitler to become dictator through constitutional means.

REVIEWS

Grapes from Thorns and Figs from Thistles

C T Kurien

The Curtain of Poverty: Choices for the Third World by Mahbub ul Haq; Oxford University Press, Delhi, 1978; pp 247, Rs 25.

MAHBUB UL HAQ's name became familiar in our country in the early seventies when it came to be known that one of Indira Gandhi's speeches on her new and radical economic strategy to make a frontal attack on poverty was based on one or two of Haq's equally radical pronouncements to stand economic theory on its head.* Haq, economist trained in Cambridge and Yale, former member of Pakistan's Planning Commission, and currently Director of the Policy Planning and Programme Review Department of the World Bank has been a champion of the cause of the poor and continues to be an articulate spokesman for the Third World, In this book he gives an evolution of his thinking on poverty and outlines the choices for the Third World. The book is neither autobiography nor a collection of speeches and articles although it has a sprinkling of all these. It is a different kind of book wherein on each major issue the author gives his past position and his present views. It is, therefore, a sort of a biography of ideas. It is divided into three parts, the first dealing with the problem of poverty within the Third World and the next two examining broader international aspects.

The four chapters in Part I outline the revolution that Haq brought about in the thinking on economic development including his now famous keynote address to the 12th World Conference of the Society for International Development, Ottawa, May 1971, in which he criticised the GNP oriented development policies which relegated to the background social justice and the eradication of poverty and unemployment. "Let us stand economic theory on its head" said Haq. "We were taught to take care of our GNP as this will take care of poverty. Let us reverse this and take care of poverty, as this will take care of GNP". These words to which "the academic community in the Western World reacted in shocked disbelief" and which were received with great acclaim by the leaders of the Third World ushered in a major shift in the thinking on development, claims Haq. This is true if we see how rapidly the idea began to spread. After the first shock wore off leaders of the Western World also came round to the same view. In September 1972, just after two of Haq's speeches, McNamara spoke for many of them (says Haq) when he exhorted the Board of Governors of the World Bank, and all aid givers and receivers, to give the highest priority to the needs of the most deprived 40 per cent of the populations of the developing countries.

But was this a revolution or a passing fashion? Haq, the creator of ideas is realistic enough to admit that in less than half a decade the revolution had become passè:

> The concern for the bottom 40 per cent is in danger of becoming an intellectual and political fashion rather than a serious policy issue. Conferences and seminars are being organised every day, with such breathless rapidity that almost the same *participants stagger on from one place* to the next bemoaning the fate of "the by-passed people", "the marginal man", "the bottom 40 per cent", "the forgotten majority", etc, in relatively comfortable and exotic surroundings in which these conferences are increasingly held. There is little serious work on the dimensions of poverty and concrete policies to tackle, particularly in the developing world whose problem it basically is.

How ironically true that in our days ideas have wings, but not feet! Haq, however, is optimistic because he believes his ideas are correct. And every now and then he makes a wistful reference to China ("The secret visit of Henry Kissinger to China in March 1971, which was revealed shortly after my first speech, made it somewhat easier to talk about China's development experience in American forums") and asserts "it can be done". Apparently Haq's enlightenment has not led him to see that it is not possible to gather grapes from thorns and figs from thistles. Also, as long as there is no immediate "danger" of the rest of Third World countries doing what China did, there is no harm in urging them to do so.

In his treatment of the international aspects of poverty Haq makes effective use of the insights he has gained as a former member of Pakistan's official delegation to the aid consortia, as member of many United Nations agencies and as a senior officer of the World Bank. He reveals something of the inner workings of aid diplomacy holding back only subjects that are "too recent and too delicate". His assessments of the "Limits to Growth" debate, the environmental threat and the population burden are incisive and expose many of the hidden and not so hidden fallacies in the global discussions on these issues. What emerges clearly is the high propensity of the richer nations of the West to turn all global and future issues to reinforce their own economic positions and privileges now. It is against this background that Haq enters into a discussion of the New International Economic Order. His message is that "poor nations must organise their 'poor-power' [to] wring major concessions from the rich Nations", and that the movement to have a New International Economic Order must be viewed "as the birth of a new international trade unionism of the poor nations where the Third World was serving notice that it would negotiate with the developed countries in the future through the instrument of collective bargaining". Haq identifies the bargaining power of the poor countries. The first is their numerical strength. They now constitute 70 per cent of the world's population, which is likely to go up to 80 per cent by the turn of the century, and may be even 90 per cent by the middle of the next century. No wonder the *Western world is concerned about the* growth of population in the developing countries! Secondly, the spread of nuclear capability among the Third World countries will add to their bargaining power. Their control over most of the agricultural raw materials is another, and so their vast potentials as markets. Third World countries must also make use of any advantage they come to have to press for structural changes in the international economic order. Thus "the international

*Of this episode Haq has this to say in the book: "The reactions [to his speeches of 1971 and 1972] in the Third World was encouraging....The Prime Minister of India, Mrs Indira Gandhi, paid a particularly flattering tribute by including many portions of these speeches, almost verbatim, in a major policy speech of her own on India's development strategy." And he adds in a footnote: "This led to some unfortunate embarrassment for her in the press which criticised her, unfairly, for quoting a Pakistani economist without acknowledgement."

monetary system can be restructured simply through the device of OPEC members insisting on payments for their oil exports in SDRs, rather than in national reserve currencies of the rich nations".

In connection with the NIEO, the Third World countries must not succumb to the baits being frequently thrown out for marginal adjustments and for bilateral arrangements and must press hard for structural changes. These must include a World Development Authority which will have power to determine major development issues of the world, an International Central Bank with power to create an international currency, an International Development Fund to be formed on the basis of international taxation, such as 10 per cent of expenditure on armaments, an International Trade Organisation and a World Food Authority.

These, again are good ideas. But in this case it is doubtful whether they will even come to have wings, at least in the near future.

I G Farben and the Third Reich

Frederick F Clairmonte

Crime and Punishment of I G Farben by Joseph Borkin; The Free Press, London, 1978; pp 250.

PERHAPS no economic sector of the German economy from Bismarckian unification to the smashing of the Third Reich so richly exhibits the interrelationship of big business and political power as the chemical industry. From 1856, when the pioneer discoveries of the 18-year old English chemist William Henry Perkins laid the foundations of the dyestuff industry, the strides of the chemical industry were partnered by uninhibited economic concentration. By the turn of the century three major corporate giants (BASF, Bayer and Hoechst, ultimately to become I G Farben, and to emerge after 1945 as I G's successor firms) dominated an industry which in its scale of operations, research and marketing capabilities leapt the confines of Imperial Germany.

In his thorough documentation of I G Farben's ascendancy Borkin, chief legal analyst of the patent and cartel section of the Antitrust Division of the US Department of Justice (1938-46) dissects its corporate relationships to 1945 and beyond. "Without I G Farben and coal", declared Streseman of the Weimar republic, "I can have no foreign policy". But its pre-eminent services were to be reserved for the Third Reich a decade later. For with coal and I G, Hitlerian rhetoric was immediately translated into an almost impregnable military phalanx.

I G's corporate structure, as with several other corporations of the time, was directly modelled on John D Rockefeller's Standard Oil Trust at the turn of the century. Under the pressures of a war economy and the post-war dislocations, Germany's chemical corporations became formally integrated on December 9, 1925, which immediately triggered the mergers within the British chemical industry under the auspices of Imperial Chemical Industries in 1926. I G's status as one of the giant transnational corporations was now to be swiftly consolidated through a maze of cartel agreements with other chemical giants: Kuhlmann (France), ICI (UK) Montecatini (Italy), Aussiger Verein (Czechoslovakia), Boruta (Poland), Mitsui (Japan) and Du Pont, Dow and Standard Oil of the USA.

By 1937, I F Farben's nazification was completed with all leading members of the board transformed (with one exception) into Nazi party activists. I G had become not merely the most generous financial contributor to the Nazi coffers (to be handsomely rewarded with takeovers of the chemical industries in occupied territories), but fuelled the techno-scientific power of Nazi expansionism. It produced almost all of the synthetic oil (direct and by licence), synthetic rubber, poison gases, magnesium, lubricating oil, explosives, methanol, sera, plasticisers, dyestuffs, nickel and thousands of other items of Hitler's war machine. Never before in the history of militarism had a spokesman of big capital (Krauch) occupied such a vital role in the military planning of war: the apotheosis of Eisenhower's concept of the industrial-military complex.

Auschwitz, the name of that Polish village, was but one component of that complex which Krauch had personally selected, the I G Auschwitz industrial complex, operated by slave labour, was financed exclusively by I G's capital at the astronomic cost of $US 250 million with its own private concentration camp. The first experimental and highly successful mass killings by Commandant Hoess, using Zylon B, under the supervision of the "devils' chemists" as they were subsequently branded by General Telford Taylor, involved 500 Soviet war prisoners in August 1941. Without discrimination the floodgates of death now swung wide open to all ages, all nationalities, all races.

On May 12, 1948, the trial of I G Farben's war criminals ended in the cold war ambience that descended on the Nuremberg tribunal. I G's five leading executives received sentences from 7-8 years on charges of "slavery and mass murder"; seven others received 1-4 years for "plunder and spoliation". The defence, as Telford Taylor had foreseen, had no difficulty in arguing that I G's executives were, as with their counterparts in other countries, normal businessmen, godfearing, family men. Since 1917 (a thesis also paraded before Marshall Foch and President Wilson by those charged with using poison gas in 1914-1918) the leaders of the chemical industry had battled Bolshevism. This repertory was to be relentlessly heard. Indeed, Krauch's counsel suffered no embarrassment in presenting Hitler as a prophet: "How right Hitler was in this outline of his policy....might be confirmed by the political situation which has developed in recent weeks in Europe", i e, 1947-1948. Such was the ultimate rationale on which the 'father of Auschwitz' rested his case. Chief Prosecutor Josiah Du Bois regarded the sentences as "light enough to please a chicken thief" and exploded as he walked out of the tribunal: "I'll write a book about this if it's the last thing I ever do." Which he did. But the tide had ebbed.

This volume is the product of decades of reflection that reads like fiction. A host of questions call for amplification, notably I G's connections with the world chemical and petroleum cartels and concealments of its overseas interests from the Nuremberg investigators. But this is a trivial caveat for the prodigious repast that Borkin has served us.

Economy of GDR

ECONOMIC growth in the German Democratic Republic is expected to reach 4.3 per cent in 1979, according to revised official estimates. This figure is below the 5 1 per cent growth target for the government's five-year economic plan. The chief obstacle to higher growth is the unavailability of increased fuel supplies from the Union of Soviet Socialist Republics—the country's main oil source The USSR will provide the German Democratic Republic with only 777 million barrels of oil in 1979, at a lower-than-market price, enough to meet only about 80 per cent of the country's oil requirements; the remaining 20 per cent will have to be bought at higher prices and in hard currency from other suppliers In order to obtain the currency to pay for the needed fuel imports, the Government has embarked on an export promotion plan.

Net Foreign Exchange Earnings from Export of Industrial Manufactures, 1974-75 to 1977-78

N J Jhaveri
L Bhagirathi

This article examines the export performance of 153 companies for the four years 1974-75 to 1977-78. In addition to examining trends in exports in relation to total sales, an attempt is made to bring out the direct balance of payments impact of the companies constituting the sample.

EXPORTS of industrial manufactures from India have registered a rapid rate of growth during the 1970s. A large majority of studies on the subject have confined themselves to analysing the commodity composition and destination of such exports. A study carried out by the Industrial Credit and Investment Corporation of India attempted an analysis of the financial profitability and competitiveness of exports for a cross-section of manufactured goods ("Export Performance of Companies": ICICI Portfolio, published by ICICI in December 1977). The ICICI study, based on information collected from the companies assisted by it, covered three years 1972-73 to 1974-75.

The present study analyses the export performance of 153 companies (as against 60 companies in the earlier study) for the four years 1974-75 to 1977-78. Unlike the previous study, information for which was collected through a specially designed questionnaire, the source of information for the present study is published annual reports. In addition to examining trends in exports in relation to total sales, an attempt is made to bring out the direct balance of payments impact of 153 companies constituting the sample.

The 153 companies, though they account for over 25 per cent of total paid-up capital of the private corporate sector, would account for a much larger proportion of the paid-up capital if one were to take only exporting companies to constitute the population. The coverage, therefore, is not insignificant. Nevertheless none of the quantitative data can be blown up to derive the picture for the corporate sector as a whole. However, we believe that an analysis of export performance of a sample of companies provides an insight, which is useful for policy.

More than the size of the sample, one could object to the partial nature of the analysis. The direct balance of payments impact, one could argue, is of limited usefulness since it does not allow for foreign exchange outgo at the earlier stages—i e, at the intermediate and input manufacturing stages. We are aware of this limitation. But details for such a total analysis are not available. At the same time, we would like to point out that, since our sample consists of companies engaged in manufacturing basic, intermediate, capital goods and to an extent final products, the direct balance of payments impact at different stages in production is taken into account.

Concepts and Methodology

The direct balance of payments impact is measured by net foreign exchange (FE) earnings. These are derived by *deducting* the foreign exchange outgo on current account (comprising payments in foreign currency by way of commissions, royalties, technical fees, interest, dividends, import of raw materials and spares, and expenses incurred on foreign travel), from the value of exports, plus other income (which are small amounts) in foreign exchange. Positive net foreign exchange earning indicates contribution of an exporting company to balance of payments; negative earning represents draft on balance of payments.

The c i f value of imported capital goods is not included in FE expenditure for the following reasons. If import of capital goods is financed through foreign loan, the actual outgoing in foreign exchange would take place in future years when loans are repaid in instalments. If foreign equity holding is created for an amount equivalent to the value of imported equipment, the outgo would take place when foreign holding is liquidated. Since debiting the value of imported capital goods in a single year would distort the net foreign exchange impact for that year, we considered making an adjustment for capital goods import by assuming payments in instalments. In the absence of details about either the source of finance or the life of equipment, we discarded this alternative. Instead of making adjustment on an *ad hoc* basis, we have examined the net balance of payment impact by considering FE expenditure both including and excluding payment for capital goods. As regards servicing of foreign exchange liabilities, current outgoes in the form of interest and dividends are deducted from FE earnings in the concerned year.

The sample companies are divided into 12 broad product groups; 14 companies, however, had to be placed in a miscellaneous category. A limitation of industry classification of the sample should be borne in mind. An individual company is included in a particular industry group on the basis of the weightage of products in its sales Thus if 75 per cent or more of sales are accounted for by certain products, that would determine its industry group In some cases, exports might be of products which constitute a relatively small proportion of sales.

Here, mention should be made of the inclusion of 'Tata Exports' in the miscellaneous industry group. While a commodity-wise break-up of its exports is not available, the major portion of exports is accounted for by commercial vehicles, chemicals, and textiles. Since exports by this company could not be

allocated to respective industry groups, FE earnings of some industry groups would be understated.

Export Performance

Exports of 153 companies registered an increase of nearly 115 per cent between 1974-75 and 1976-77. In 1977-78, there was only a marginal increase, of 2.2 per cent. Since the rate of growth in export sales was faster than that in domestic sales, export to total sales ratio (export ratio) in the case of 153 companies increased from 5.1 per cent in 1974-75 to 8.8 per cent in 1976-77 and remained at that level in 1977-78. Frequency distribution of industry groups, by size-classes of export to sales ratio, shows that as against only one in 1974-75 as many as six industry groups exported 8 per cent or more of their sales in 1976-77 and 1977-78 (Table 1).

Industry-wise, during the period, export of automobile (commercial vehicles) and auto ancillaries, metal products (ferrous), rubber and rubber products, and 'miscellaneous' items, recorded a steady improvement (Table 2). Export performance of companies in the industry groups of electrical equipment, machinery manufacturing, and cotton textiles improved modestly.

Domestic Recession and Exports

Differences in inter-company performance within the same industry are quite marked in India. This is more true in the case of exports than in the case of domestic market operations, because of the intense competition in the international markets. Therefore, inferences drawn on the basis of industry-level data suffer from certain limitations.

Nevertheless, it would seem to be a plausible hypothesis that the recent rising trend in export ratio was attributable to recession in domestic demand. Confronted with domestic recession, the Indian industry tends to look out for international markets. Such a trend was observed in the aftermath of the 1966 recession (see the ICICI Export Study).

Besides domestic demand recession, the devaluation of the rupee in 1966 might have encouraged exports from India, by increasing their international competitiveness. But, during 1974-75 to 1977-78, the fall in

Total	87.8	86.9	88.3	85.0

external value of the rupee was modest. A pick-up in exports during this period would, therefore, suggest long-term improvement in competitiveness of exports of manufactures.

Another factor which is likely to have contributed to improvement in exports is, the availability of 'export incentives'. Although, with the rising volume of exports, the total quantum of 'export subsidy' paid through the Central budget has increased, rates of export incentives have not generally increased during the last three years. What matters from an exporter's point of view, however, is the rate of export incentive.

It would be useful to note in this context that to the extent 'export incentives' compensate for a high incidence of input taxation, availability of such incentives neutralises distortion in the international cost-competitive position of Indian exports introduced by indirect taxation. Whether export incentives exceeded input taxation in the case of the sample companies is difficult to ascertain, as data relating to such taxation are not available. Nor are the details of export incentives received by the sample companies.

But two points deserve mention in this context. First, till recently, one of the major export incentives was replenishment licences which enable access to imported inputs which are not otherwise available. In a situation of shortages, replenishment licence-holders are placed in a privileged position. Probability of disruption in their production, on account of non-availability of scarce inputs, is less than in the case of non-exporting producers. Again, due to domestic shortages and restriction on imports, comparable domestic inputs enjoyed a high effective protection. This was reflected, till the early 1970s, in high rates of premium on replenishment licences. The premium has now virtually vanished. Consequently, at present, this could not be considered a major motivation for exports.

Secondly, the availability of export incentives, which would be reflected in the computation of profits (as other income), would not seem to have arrested the declining trend in profit margins. Ratio of gross profits to net sales of the 153 companies declined steadily from 15.5 per cent in 1974-75 to 13.2 per cent in 1977-78. Profitability in industry-groups which improved the export ratio during the period (such as miscellaneous, metal products-ferrous, rubber and rubber products) also showed a similar trend (Table 3).

It would seem a plausible hypothesis, therefore, that the interest of Indian industry, or at least of some of its sections, is based on considerations of developing export markets. A frequency distribution of export ratio of companies also corroborates such a hypothesis. For instance, the number of companies in whose case exports accounted for more than 10 per cent of the total sales increased from 28 in 1974-75 to 45 in 1977-78 (Table 4).

FE EXPENDITURE

Contrary to a steady increase in export earnings, FE expenditure on current account till 1976-77 was lower than in 1974-75. But it increased sharply in 1977-78. The movement in current FE expenditure from year to year was dominated by payments for raw materials which were directly imported. We have classified FE expenditure into the following categories: (a) Commission (related to sales); (b) Royalty and Technical Fees (related to import of technology), (c) Interest and Dividend (related to servicing of foreign capital); (d) Raw Materials (related to production); (e) Travelling (related to export promotion); (f) Spares and Components (related to maintenance); and (g) Others (Table 5).

An overwhelming proportion of FE outgo in the case of 153 companies was accounted by imports related to production (*viz*, raw materials) and to maintenance of the productive capacity of equipment (*viz*, spares and components). The next important item was payments in the nature of servicing of foreign capital. The increase was mainly accounted by dividend payment on foreign equity, outgo on account of which increased from Rs 7.8 crores in 1974-75 to Rs 19.0 crores in 1977-78. Dividend payment by 23 companies in the industry group of chemicals and petrochemicals, and 17 companies in the group of electrical equipment, accounted for Rs 10.3 crores out of Rs 19.0 crores paid out to foreign equity holders in 1977-78.

As regards spares and components, the bulk of the imports and increase in their level during the period was accounted for by capital goods industries—such as automobiles and auto ancillaries, machinery manufacturing and metal products (ferrous) The only other industry which accounted for significant import of spares and components was chemicals and petro-chemicals. Imports of spares and components in industries, such as automobiles, might be to an extent a direct consequence of their rising exports as some parts (e g, braking system) in exported vehicles are imported to meet with specifications stipulated in countries of destination.

Notes. * 1 company is exempted from giving this information.

FE expenditure; consists of spares & components, raw materials, commission, royalty, technical fee, travelling, interest dividends and others.

FE income consists of exports and other FE income.

A rising trend in imports of spares and components and raw materials might also be attributed to liberalised import policy and a hike in oil prices. For instance, raw material imports by companies in the industry group 'chemicals and petrochemicals' increased from Rs 35.3 crores in 1974-75 to Rs 67.7 crores in 1977-78. Increase in the import bill for raw materials in the industry group cotton textiles, from Rs 12 crores in 1974-75 to Rs 45.4 crores in 1977-78, however, is likely to be the result of larger imports of synthetic fibres under the liberalised import policy.

Despite these increases in import of spares, components, and raw materials, the indigenous content in the total raw materials and spares and components consumed has remained fairly high (Table 6). Excepting cotton textiles (from 91.5 per cent indigenous content in 1974-75 to 82.0 per cent in 1977-78) and electrical equipment (from 82.7 per cent to 78.6 per cent), the decline in the proportion of indigenous content is moderate. In the case of certain industry groups, such as automobiles and auto ancillaries, the proportion of indigenous content has gone up.

Net FE Earnings

Taking the 153 companies as a whole, net FE earnings (i e, FE income less FE expenditure on current account) shot up from Rs 13.0 crores in 1974-75 to Rs 263.6 crores in 1976-77. In 1977-78, as a combined result of deceleration in the growth rate of export earnings and a marked rise in FE outgo, mainly on account of import of spares, components and raw materials, net FE earnings declined to Rs 148 crores.

Industry-wise, automobiles and auto ancillaries had the most favourable turn around, from the net FE earnings point of view (Table 7). From a net FE draft of Rs 25.7 crores in 1974-75, 12 companies in this industry group emerged in a net FE earnings position of nearly Rs 15 crores. Likewise, 16 companies in the industry group metal products—ferrous—earned, on net basis, foreign exchange of the order of Rs 20 crores (down from Rs 32 crores in 1976-77) against net user of Rs 4.1 crores of foreign exchange in 1974-75. In miscellaneous industry group, 14 companies contributed foreign exchange worth Rs 115.5 crores in 1977-78—an increase of 254 per cent over the 1974-75 level.

On the other hand, draft by machinery manufacturing companies on foreign exchange increased, from Rs 3.8 crores in 1974-75 to Rs 9.8 crores in 1977-78. Companies in the industry group chemicals and petrochemicals ended with net draft of foreign exchange of the order of Rs 33.8 crores in 1977-78.

Import of Capital Goods

The value of capital goods imported by 153 companies has remained fairly stable during the period. Import of capital goods was Rs 26.7 crores in 1974-75; after fluctuating in a narrow range during the following two years, capital goods import increased to Rs 32.4 crores in 1977-78. Even taking into account payment for capital goods, 153 companies had a net FE earning of Rs 115.5 crores in 1977-78—a sizeable improvement from their net draft on foreign exchange of Rs 15.4 crores on a comparable basis.

Implications for Policy

Industry-wise information, though useful, s only the first phase of the analysis. Determinants of export performance of individual companies could be many, and need a careful study. In the same industry group, in a more or less comparable product group, export performance of individual companies is known to vary. For instance, export ratio in respect of 18 composite cotton textile companies varied from barely one per cent to 30 per cent in the same year. While some of the attributes of good export performance cases might be company-specific, others would be product-specific. Knowledge of these attributes would help more appropriate formulation of export policies.

In some cases, a major factor thwarting export efforts could be high effective protection of the input industries. In such cases, though export production is competitive provided inputs are available at international prices, exports are not profitable because of the inadequate compensation through duty drawback to export industry. Likewise, duty drawbacks if fixed as specific amounts (instead of *ad valorem*) would inadequately compensate for indirect taxation if market prices of inputs rise for any reason. An across-the-board liberalisation, or tightening of export incentives, when exportability of different products varies in a wide range would not prove to be a competent solution to the problem.

By the same token, insistence that all importers should earn, either in part or full, the foreign exchange to pay for their imports is not an efficient solution. Imposing an export obligation as a matter of practice would result in earning foreign exchange at a disproportionately high real resource cost. Both the export obligation and the export incentives, therefore, should be based on an assessment of the export competitiveness of the products. The experience of the last few years has shown that, even if there is no increase in the nominal rate of export incentives, better availability of inputs at reasonable prices, encourages export effort by lowering the rate of effective protection in the input industries. Likewise, a situation of domestic shortages of exportable output could discourage exports by raising the level of effective protection. A liberal import policy, therefore, though it might create initial problems of adjustment for the indigenous industry, is likely to encourage exports of industrial manufactures.

[Views expressed here are the personal views of the authors.]

JAWAHARLAL NEHRU UNIVERSITY

NEW DELHI-110067

Advt. No. Aca.III/11/79

Applications are invited for the following posts:

SCHOOL OF INTERNATIONAL STUDIES:

Centre for International Politics & Organisation:

1. **Associate Professor/Fellow or Assistant Professor in International Organization.**

Associate Professor/Fellow:
Qualifications:
Essential:

(a) Consistently good academic record with at least a high second class Master's degree in Political Science. History or Economics or its equivalent qualification from an Indian/foreign University;

(b) A Doctor's degree or published work of an equally high standard in the field of International Organisation; and

(c) About five year's experience of teaching and/or research in International Organisation.

Desirable:
Some experience of research guidance in the field of International Organization.

Assistant Professor:
Qualifications:
Essential:

(a) Consistently good academic record with at least a high second class Master's degree in Political Science, History or Economics or its equivalent qualification from an Indian/foreign University;

(b) A Doctor's degree or published work of an equally high standard in the field of International Organisation; and

Desirable:

(a) Some teaching and/or research experience in International Organisation.

Note: There is only one vacancy of an Associate Professor/Fellow; the University will consider applications for both Associate Professor/Fellow and Assistant Professor, or either only.

Centre for Studies in Diplomacy, International Law and Economics:

2. **Associate Professor/Fellow of International Trade and Economic Development:**

Qualifications:
Essential:

(a) Consistently good academic record with at least a high second class Master's Degree in Economics or an equivalent qualification from an Indian or foreign University;

(b) A doctor's degree or published work of an equally high standard in Economics; and

(c) About five year's experience of teaching and/or research in Economics.

Area of Specialisation: International Trade or Economic Development.

Desirable:
Acquaintance with mathematical and statistical method.

Provided that in the case of Assistant Professor if the Selection Committee is of the view that the research work of a candidate as evident either from his thesis or from his published work is of very high standard, it may relax any of qualifications prescribed in (a) above.

Provided further that if a candidate possessing a Doctor's degree or equivalent research work is not available or is not considered suitable, a person possessing a consistently good academic record (weightage being given to M.Phil. or equivalent degree or research work of quality) may be appointed **provided he has done research work for at least two years or has practical experience in a research laboratory/organisation** on the condition that he will have to obtain a Doctor's degree or give evidence of research work of equivalent high standard within five years of his appointment, failing which he will not be able to earn future increments until he fulfils these requirements.

Continued

SCALES OF PAY:

Associate Professor/Fellow	Rs 1200-50-1300-60-1900
Assistant Professor	Rs 700-40-1100-50-1600

plus usual allowances as admissible to the members of the staff in the Central Universities.

Relaxation in any of the qualifications may be made (a) in favour of persons of eminence or of high academic professional distinction, and (b) in exceptional cases where adequately qualified persons are not available but are otherwise found suitable for the respective positions. It will also be open to the University to consider the names of suitable candidates who may not have applied.

The selected candidates will be expected to participate in the teaching and research programmes in the concerned disciplines in other Schools of the University as well as in the programmes offered in their own Centres of Studies.

Normally appointment of Fellows is made on contract basis for a period ranging from one to three years.

Benefits of C.P. Fund-cum-Gratuity/G.P. Fund-cum-Pension-cum-Gratuity are available as per University rules.

Persons already in employment should route their applications through proper channel.

Due consideration will be given to candidates belonging to SC/ST at the level of Assistant Professor.

Second class (mail) rail fare (both ways) will be paid to candidates invited to appear for interview from outstation by the shortest route subject to the production of rail receipt.

Applications, separate for each post, on the prescribed form, obtainable free of cost from the University by sending a self-addressed and stamped envelope of 23cm × 10cm size to the DEPUTY REGISTRAR (ACADEMIC), JAWAHARLAL NEHRU UNIVERSITY, NEW MEHRAULI ROAD, NEW DELHI-110 067, should reach him latest by **22nd June** 1979.

Candidates from abroad, applying for faculty positions, may apply on plain paper, (but their applications should reach the University by the last date) furnishing all the relevant informations such as their names, date and place of birth; marital status; nationality; state of domicile; postal and permanent addresses; father's name and address; academic and professional attainments; full details of (a) publications, and (b) research projects undertaken; language(s) known, details of visits to foreign Countries; and the name and addresses of at least two persons well acquainted with the candidates professional work who should also be requested by the candidate to forward to the Deputy Registrar (Academic) confidential report concerning the candidate.

[illegible]

The original programme drawn out for the Prime Minister's recent visits to Poland, Czechoslovakia and Yugoslavia, included only a brief stopover at Moscow; but this was later changed to a full-fledged visit lasting four days, including two days of talks in Moscow with the Soviet President and Prime Minister, even though such high-level exchanges had taken place just three months ago in Delhi during Premier Kosygin's visit to this country. These high-level deliberations in which the Soviet president actively participated (in the midst of pressing preoccupations like the ensuing Vienna summit and the signing of SALT II) could not have been only about the rather routine series of agreements arrived at towards the end of the talks, which were anyway being taken care of by the fifth meeting of the Indo-Soviet Joint Commission which too was meeting in Moscow at the same time. The Prime Minister's extended stopover in the Soviet Union was essentially political in nature, intended to be a further sign of India's close links with the Soviet Union.

There has of course never been any doubt on this score; the change-over from Congress rule to Janata rule in Delhi has not meant any marked change in this country's close ties with the Soviet Union. The joint statement issued at the end of the Prime Minister's visit reaffirms the "traditionally close and cordial relations" between the countries and, for the sake of record, also mentions various individual aspects of this relation, including the Treaty of Peace, Friendship and Co-operation between the two countries.

Leaving aside these general and specific references to matters of bilateral interest, the only third country mentioned in the joint statement (apart from the general reference to 'Israeli troops' in occupied Arab territories) is Afghanistan. Indeed, Afghanistan seems to have dominated the talks even to the exclusion of the situation in Southeast Asia (which is merely described as being 'complicated' in the joint statement), so much so that the sentiments in the agreed paragraph on Southeast Asia in the joint statement could well be endorsed by all the parties engaged against each other in that region. Also, the unscheduled press conference addressed by Premier Kosygin on Tuesday was notable for its (relatively) less strident diatribes against China (probably because the Soviet Union is itself presently engaged in efforts to improve state-to-state relations with China), while the extreme worry about the developing situation is Afghanistan was unmistakable. Further, unlike on earlier occasions when Soviet and Afghan official statements had tended to lump together Pakistan, Iran and China as forming a reactionary alliance against the Afghan revolution, Kosygin's comments on Tuesday singled out Pakistan as encouraging opposition to the Tarakki regime. In fact, the Soviet leaders seem to have tried to recruit India into an anti-Pakistan alliance unlike barely three months ago when a similar invitation to join an anti-China alliance was extended to this country during Kosygin's visit to Delhi.

Whether or not it is part of Soviet calculations, and there is no reason why it should not be, it is a fact that the idea of playing the gendarme in the South Asian subcontinent, maintaining "stability and order" in the region, is bound to appeal to Indian ruling circles far more than any proposal to get involved in the goings-on in Indo-China or Southeast Asia. Assurance of Soviet military, economic and political support to make this role sustainable — without any attempt to be even-handed as between India and Pakistan or to maintain a power balance between the two countries, as the United States has from time to time sought to do — should be expected to provide a sound enough basis for co-operation and collaboration between Indian ruling circles, whether these happen to be represented for the moment by the Janata or Congress or some other party, and the Soviet Union. After all, this was the basis on which India was persuaded to sign the Treaty of Peace, Friendship and Co-operation with the Soviet Union in 1971, on the eve of the Indian army's march into what was shortly to become Bangladesh.

Clearly, the developing situation in Afghanistan has been of such a kind as to cause great concern to the Soviet Union. While on the one hand the crushing of the 'counter-coup' in August last year and the purge of many notable leaders of the Afghan revolution that followed in December has meant virtual elimination of opposition from the 'left', the Tarakki regime has been notably less successful in meeting the opposition from the Islamic 'right', the Hazbe Islami, operating from across the border in Pakistan. There were reports, as early as in June 1978, of the formation of a so-called

'National Rescue Front'. And since the beginning of 1979, both Afghanistan and the Soviet Union have repeatedly accused Pakistan of supporting the Islamic opposition to the Tarakki regime.

It is quite likely that opposition to the present regime in Afghanistan has the moral and, possibly, also the material support of Pakistan. But there are also influential elements in Pakistan itself who are opposed to a policy of confrontation against Afghanistan; and Afghanistan too has been trying to improve its relations with Pakistan. Pakistan's application to join the non-aligned movement was not very seriously opposed by Afghanistan in Colombo, in contrast to the very clear and explicit opposition voiced by the Afghan leaders during the Indian Foreign Minister's visit to Kabul in September last.

In view of these cautious moves towards mutual accommodation between Afghanistan and Pakistan, and indeed, in view of the opposition expressed in the Indo-Soviet joint statement to "any interference by outside forces in the internal affairs of Afghanistan", it is strange that the Soviet Prime Minister should be attempting to inveigle India into involving itself in the Pakistan-Afghanistan conflict.

Space Programme

Multilateral Basket

ANNOUNCEMENTS of the launching of the second Indian satellite, Bhaskara, from a Soviet cosmodrome have been on a considerably lower key than those which heralded the launching of Aryabhata in April 1975. Apart from the political capital which Indira Gandhi's government found useful at that time, Aryabhata had very limited objectives and several of those had to be abandoned when the power supplies to the scientific experiment packages failed after the first few orbits. Bhaskara (earlier called SEO, satellite for earth observations) weighs 430 kg and carries a TV camera and a microwave radiometer in addition to a few experimental packages. With this equipment, it is possible for the satellite to telemeter back to earth both visible and microwave frequency pictures which can be used, for example, for studies in hydrology and oceanography, respectively.

Until all the systems on Bhaskara have been made operational, it is difficult to evaluate the success of the launch. However, even viewed optimistically, the practical utility of the data that can be collected is limited by the nature of the orbit and the type of on-board sensors. Bhaskara's TV camera can provide, at best, gross pictures of the subcontinent which can be analysed to identify forests, water resources and geological formations, while its microwave radiometer can scan the surface activity of the surrounding ocean. The volume of information collected in each orbit is also limited by the fact that it has to be telemetered back to one of the two Indian ground stations as the spacecraft passes over India. Another limiting factor is, naturally, the concern of the Russians that Bhaskara's observations be kept within 'safe' bounds. However, even without these constraints, it is far from clear that it is the lack of such data which is responsible for the inaction of the user government departments.

The primary purposes of Bhaskara appear therefore to be to test Indian knowhow in satellite construction and in the operation of the ground stations at Sriharikota and Car Nicobar. That the construction of even such a satellite has difficulties is illustrated by the most recent postponement of the launching from 1st December to this June. These difficulties are both in the fabrication of reliable systems and in the procurement from abroad of basic materials, space-qualified components and subsystems (such as the TV camera on Bhaskara).

Viewed in this context, Bhaskara is one of the steps towards what is eventually planned: the launching of a significant Indian satellite by an Indian launch vehicle. (The first Indian launch vehicle, SLV-3, which is expected to be test flown in the next few weeks, will only be carrying a small 40 kg satellite for test purposes.) Bhaskara II, whose launch is now being promised for the end of the year, will differ from its predecessor only in having a TV camera with a narrower spectral band. This will be followed by the more complex geo-stationary satellite, Apple, to be launched in mid-1980 on a test flight of the European Arcane Launcher, and the INSAT 1A and INSAT 1B satellites being built by Ford Aerospace and to be put in orbit by NASA late in 1980 and in 1981. It can easily be seen that — competence aside, India's space options rest in a sort of multilateral basket whose composition will be determined more by political action than by technological choice. French, Russian, European and US assistance will be strictly proportional to the dependence they create for further supplies from these countries. Notwithstanding the talk of international co-operation in space, all foreign assistance will change its complexion if a completely Indian satellite launch is attempted, as predicted now, in the late 1980s. For that will open up the same set of possibilities that were threatened by the Pokharan explosion: a potential nuclear capability and high-powered rocket technology have unmistakable strategic implications.

Small Industry

Many Allurements

THE government had set a target, to be achieved by the end of March 1979, that commercial banks' advances to 'priority sectors' should be 33 per cent of their total advances. In their bid to reach this target, banks have apparently sometimes resorted to practices which actually infringe rules and procedures laid down by the Reserve Bank and the government. Some evidence of this is contained in the recent NCAER study on "Operations of Credit Policies of Commercial Banks since 1969" which has brought out that a substantial part of the increase in priority sector lendings in recent years is due not so much to fresh advances as to accumulated interest dues on not-so-regular accounts. There are cases where, despite repayment of one-fourth or so of the loan, the outstanding in the account is higher than the original loan. This is clearly in contravention of the RBI directive to banks that they should keep the interest account separate from the loan account.

Again, some recent reports have suggested that as much as 40 per cent of banks' advances to small-scale units are siphoned away to bigger industrial units. This is done in many ways: by large industrial houses sponsoring of a host of small-scale units to corner scarce raw materials or credit; by diverting money for purposes other than those for which it is intended such as speculation in commodities, trading, etc; by indulging in re-lending activities through the medium of shroffs or local money-lenders. The NCAER study referred to earlier has cited some instances of such practices. Thus there were cases "where units were enjoying credit on stock of materials which are not

directly used in the industry. A paper mill, for example, was extended credit on stocks of stainless steel. In a few instances, bank officials had difficulty in judging utility of stocks or their value, as was found in several accounts of TV units".

A large number of small-scale units are registered because they get preferential treatment under income-tax, sales tax, excise duties, factories act, industrial relations laws, municipal rates, and so on. Small entrepreneurs themselves start multiple 'firms' in a single industrial shed so that they can make as many applications for raw materials, credit, etc. In this context some detailed data put out by the Reserve Bank on small-scale industries in its latest monthly *Bulletin* for January 1979 are relevant. The occasion is an annual review of scheduled banks' advances to small-scale industries, to small road and water transport operators, and for setting up of industrial estates during 1977-78 (July-June). The outstanding advances to small-scale industries formed about 12.5 per cent of aggregate bank credit in June 1974; the proportion declined to 10.6 per cent in June 1976 and, though it improved somewhat to 11.8 per cent in June 1978, it remained below the level of June 1974. As a proportion of non-food total credit, the picture is slightly better, the share of small-scale industry in such credit being 12.4 per cent in June 1974 and 14.1 per cent in June 1978. The official target of advances to 'priority sector' is, however, based on aggregate bank credit inclusive of food credit. What is more important, the genuineness of even this achievement is open to doubt. This doubt arises on account of the galloping number of small-scale units covered by bank advances. In three years, between June 1975 and 1978, the number of units increased by 115 per cent from 2,39,997 units to 5,12,942 units.

That apart, the Reserve Bank note does not raise any questions about the quality of the banks' advances to small-scale units. As the Credit Guarantee Organisation (CGO) for SSI units, the RBI is expected to inspect and take such other follow-up measures arising from its guarantee responsibilities. Even a sample check of individual accounts should reveal to it many of the quantitative, shortcomings of the banks' system of lending to small-scale units. The Reserve Bank should also have with it information on other aspects, such as the size and industry-wise distribution. The study, however, gives only the number of units, limits sanctioned, and balance outstanding — all-India, state-wise and bank group-wise.

About the decline in the average credit limit per unit from Rs 1.03 lakhs in June 1969 to Rs 0.47 lakhs in June 1978, the Reserve Bank note observes that "the steep decline in this average over the period is indicative of a sustained effort towards financing of smaller units by the banks". The state-wise details, however, show that the above development was largely the result of a very sharp rise in the number of small-scale units financed by banks in a single state, Tamil Nadu. In June 1976 the number of such units was the highest at 36,962 in Maharashtra and the second highest at 35,542 was in Uttar Pradesh and Tamil Nadu was the third with 34,746. But in two years, by June 1978, the number of bank-financed small-scale units in Tamil Nadu had increased by about 130 per cent, from 34,746 in June 1976 to 79,493 in June 1978, whereas in Maharashtra and Uttar Pradesh the increases were 21 per cent (to 44,709 units) and 60 per cent (to 56,689 units), respectively. Thus, by June 1978 Tamil Nadu had about 78 per cent more small-scale units financed by banks than Maharashtra and about 40 per cent more than Uttar Pradesh.

In terms of amount of advances, however, Maharashtra continues to dominate other states. Its share in total outstanding credit was 19.8 per cent in June 1978 against 20.7 per cent in June 1976. Interestingly, despite such a large increase in the number of units financed in Tamil Nadu, the state's share in amount outstanding declined from 10.9 per cent in June 1976 to 10.7 per cent in June 1978. Nevertheless, just three states, Maharashtra (19.8 per cent), Tamil Nadu (10.7 per cent) and Gujarat (8.6 per cent), appropriated about 40 per cent of bank credit outstanding against small-scale units in June 1978. West Bengal came fourth with 8.5 per cent.

These statistics point to one important policy conclusion, *viz*, that global targets for the country as a whole or for the 'priority sectors' as a whole are insufficient; the targets have to be sufficiently disaggregated by states and districts, by schemes and, more significantly, by size of loans.

Politics

What is an Indian Language?

THE Prime Minister has once again rejected the plea made by the Nepali Bhasha Samity, the organisation representing lakhs of Nepali-speaking Indian citizens, that their language should be given official recognition and be included in the eighth schedule of the Constitution. In Gangtok on April 9, he turned down the demand unanimously adopted by the state assembly that Nepali, spoken by the majority of the residents of Sikkim, be included in the eighth schedule; and in Darjeeling on May 30 he reiterated his rejection even though the West Bengal Assembly too had adopted a similar resolution and the state government had, moreover, accorded to Nepali the status of an officially recognised state language.

Morarji Desai's objections to including Nepali in the eighth schedule are two: one, that Nepali is a 'foreign' language, and two, that if Nepali is included in the eighth schedule, then many other sections of the population speaking a whole lot of other 'tribal' languages, also will demand the inclusion of these 'tribal' languages which, the Prime Minister fears, will lead to 'disintegration' of the country. The last occasion when the eighth schedule was expanded to include Sindhi, the reason for that inclusion was not because Sind was once 'part of India', but because of the economic and political clout possessed by the Sindhi-speakers whose total population in India is not much more than that of the Nepali-speaking Indian citizens.

Anyway, the absurdity of the plea that Nepali cannot be included in the eighth schedule because it is a 'foreign' language should be self-evident. Following this logic, Urdu and Bengali too (and even Gujarati) will be 'foreign' languages since they are widely spoken in two neighbouring foreign countries. And anyway, if Nepali-speaking Indians are good enough to vote in the country's elections and Nepali-speaking foreigners are good enough to fight and die in the country's wars, there is no reason why their language should not be considered good enough to be included in the eighth schedule.

Indeed, the case for including Nepali, linguistically part of the Indo-Aryan family of languages, in the eighth schedule has been repeatedly argued on the basis of the soundest historical, linguistic and cultural princi-

ples. (See, for instance, "National Languages Policy and the Case for Nepali" by Surendra Munshi and Tridib Kumar Chakrabarti, *EPW*, April 14, 1979.) It is not as if the inclusion of Nepali in the eighth schedule will immediately lead to demands from speakers of such languages as Konkani, or Manipuri for inclusion of their languages in the eighth schedule, or that if such demands came forth and these languages too are recognised as 'official' Indian languages, the country will be on the brink of 'disintegration'. The country's unity is not all that fragile and the instruments to ensure the further consolidation of the present unity are in very fine fettle. The reason for the Prime Minister's adamant attitude might be that such a recognition of Nepali as an Indian language might not be welcomed by the ruling circles in Nepal who might see in such a step some hidden motives. Then of course there is the need for Morarji Desai to be seen as rigid and uncompromising when once he takes a stand — that he is not the one to change his mind merely because lakhs of people unitedly make a demand. It is such petulance and arrogance, not to speak of the parochialism and a-historicity, that comes out most clearly in the stand of the Prime Minister on the question of including Nepali in the eighth schedule to the Indian Constitution.

Tripura

Developing Confrontation

THE violence in Tripura, apparently let loose by supporters of the 'Amra Bangali' movement (which is self-acknowledgedly linked to the Ananda Marg, and whose aims include, among other things, the creation of a 'Bangalistan' comprising the 'Bangali-dominated' areas of Assam, Bihar, Orissa and Andaman and Nicobar Islands, as well as West Bengal and Tripura, with Bangladesh too having the option to join it) in which 15 people have so far been killed, has not been entirely unexpected. Tension between the Tripuri people (the original inhabitants of the state) and the Bengalis (who are for the most part migrants and refugees from East Bengal) has been in existence for long, with the tribals deeply resenting the fact that they who once formed the majority in the state have now been massively outnumbered by the migrants.

The present administration has been, belatedly, taking some steps to meet the tribal demands, one of which is implementation of the provisions of the Restoration of Alienated Lands Act, 1976 passed by the previous Congress administration. Also, after failing to persuade the Centre to amend the Constitution to enable the territory of Tripura too to be included among these areas in the northeast where the provisions of the Sixth Schedule of the Constitution would be applicable, the Tripura government decided to press its own legislation in the form of the Tribal Autonomous District Council Bill which, when enacted, would ensure some kind of protection to the tribals from further alienation of their lands to non-tribals.

But the administration, which only weeks ago was apparently facing opposition from the Tripura Upajatiya Juba Samity (TUJS) over its failure to ensure protection of tribal rights, has now had to face far more serious opposition from the extreme chauvinist elements from among the Bengali population. The Amra Bangali movement has stridently opposed these moves and in the state-wide bandh called by it on this issue on January 17, one person had already been killed. Further, Teliamura itself, the scene of the current violence, had been the scene of an agitation led by the Amra Bangali in February, and later again in May.

Such manifestation of extremely strident reaction to some quite modest moves by an administration to undo some of the many injustices done to the tribal people is a relatively new and disturbing phenomenon in the northeast. If one were to go by the proclaimed aims of the Amra Bangali movement, Bengali chauvinism seems to be taking the lead all the way; and the shooting down of a non-Mizo (Bengali) PWD official in Saitul in Mizoram on Wednesday, and the reaction to the killing in neighbouring 'Bengali-dominated' Cachar district of Assam in the form of reprisals against Mizo residents in Silchar, could be a pointer to the shape of things to come in the developing confrontation between sections of the tribal population and non-tribals in some areas of the northeast. In fact, the situation seems readymade for chauvinists of every kind to thrive, and an organisation like Amra Bangali, committed to ensuring the continued dominance of the Bengali-speaking people in what it calls the 'Bengali-dominated' areas of the northeast, holds tremendous potential for mischief.

Even without the help of various forms of regional chauvinism, the tribals in the northeast have had reason to feel deeply alienated and confused about their precise position in the broader Indian society. The threatened bill to ban religious conversion which is seen as a transparent attack on Christianity; the continued exhortations to cultivate dietary habits which do not deviate from what is considered the strictest principles governing brahminical habits; the thrust of Hindi, all this, and Amra Bangali too.

It would however be wrong to see these manifestations of communal tensions purely in sectarian terms, and it would be even more wrong to try to explain them away as being due to the 'machinations' of foreign agencies, though the malignant involvement of some foreign agencies cannot be ruled out, especially in an area like the northeast which has for long been the focal point of such involvement. But such interference becomes possible precisely because objectively there is fertile ground for such interference. Bengali chauvinism or tribal separatism can thrive because the basic causes that make for such unhealthy tendencies has been left unattacked all these years.

Railways

Affected by Changing Production Pattern

A Correspondent writes:

THE performance of the railways has come in for a great deal of criticism recently. Even many government ministries, particularly the Ministry of Steel and Mines, have expressed their unhappiness over the inadequate availability of railway wagons for transportation of bulk goods like coal, iron ore and steel. The sacking of the chairman of the Railway Board has been seen as acknowledgement by the Railway Ministry that the railways' performance has left much to be desired. It is interesting in this context to examine the latest data on railway wagon loadings.

Data on wagon loadings are available for the first ten months of 1978-79, upto January 1979. Total wagon loadings have shown a decline in 1978-79 (April-January) as compared with the corresponding period of the previous year, and the decline has been with respect to virtually all major categories of commodities. Total wagon loadings on the broad gauge slumped from 76.19 lakhs to 72.40 lakhs and on the metre gauge from 17.37 lakhs to 16.28 lakhs. Cement loadings on broad

gauge declined from 3.50 lakhs in 1977-78 (April-January) to 3 lakhs in 1978-79 (April-January), pig iron from 0.60 lakh to 0.58 lakh and iron and steel 3.44 lakhs to 3.28 lakhs. Coal and coke loadings declined from 24.42 lakhs to 22.80 lakhs. Miscellaneous full wagon loadings declined from 20.14 lakhs to 19.80 lakhs on broad gauge and from 11.05 lakhs to 8.30 lakhs on metre gauge. Miscellaneous small wagons loaded fell from 1.96 lakhs to 1.76 lakhs on broad gauge and from 1.41 lakhs to 0.79 lakhs on metre gauge. Even wagons used for movement of railway stores (railways are a bulk consumer of many industrial goods) registered a sharp decline from 6.40 lakhs to 5.67 lakhs on broad gauge and 1.50 lakhs to 1.40 lakhs on metre gauge. The only increases in loadings were in respect of sugar, sugarcane and jute manufactures — which, however, together account for less than 0.50 lakh wagon loadings on broad gauge and metre gauge together.

How far do the poor wagon loadings reflect a deterioration in railway efficiency and to what extent were they the result of relatively low growth of output of the products concerned? It may be true that non-availability of wagons has resulted in diversion of traffic to road transport, but it is also true that the growth of production in a number of major industries has been relatively poor. The overall rate of growth of industrial output in 1978-79 is now placed at 7.5 per cent. Industrywise details of growth of output are available for the calendar year 1978. According to these data, though the General Index of Industrial Output (base: 1970=100) registered a growth of 6.8 per cent in 1978 (as compared with 5.3 per cent in 1977), coal output rose by just 1 per cent and cement by 2.4 per cent. The output of iron and steel basic industries declined by 0.5 per cent and the entire capital goods sector showed an improvement of only 2.7 per cent. Mill sector cloth output increased by 2.1 per cent. Thus a number of goods which meet the consumption needs of the masses or which are a prerequisite for raising the level of investment activity have showed small increases in output. The railways' performance also reflects this situation. The railways cannot transport goods if there are no goods to transport. On the other hand, the products whose output has gone up are perhaps more conveniently transported by road. The railways' inefficiency has no doubt played a part, but a part of the explanation for the slow growth of wagon loadings may lie in the changing nature of industrial output. Recognition of this fact is seen in the railways' decision this week to offer certain concessions — such as waiving of registration fees, offer of station-to-station concessional rates and transportation of goods within targeted time limits — in a bid to win back freight in 25 high-profit commodities from road transport.

LETTERS TO EDITOR

Continuing Repression in Telengana

A PUBLIC meeting is taking place at Mandammari, located in the Singareni collieries. The time is 9.30 in the night; the date, May 28, 1979, district Adilabad. Suddenly the lights go off; police attack and start beating up people indiscriminately. Among the injured is the main speaker, Varavara Rao, a leading Telugu poet and college teacher, who has been addressing mass meetings in the area. He is arrested and taken away along with Vardhana Rao, State President of the RYL (Radical Youth League).

Following his release on bail, Varavara Rao was attacked by goondas in Peddappalli in the adjoining district of Karimnagar. This area is virtually an undeclared "disturbed area" with police camps in fifty villages. A recent meeting of the RYL was reported to have been 'guarded' by 1,000 armed police.

Earlier reports have highlighted the repression going on in the Telengana area to crush the democratic movements of the peasants and the coal-miners against vested interests in that region. Firings in Panditapuram (Khammam district, January 31, 1979), firings in Mandammari (Adilabad, January 6), the mysterious disappearance of peasant leader Koteswar Rao arrested by the police (March 5, Peddapalli, Karimnagar district), preceded by the notification of Jagtial and Sircilla taluks as "disturbed areas" (October 4, 1978, Karimnagar district). Arrests, killings, police camps, and attacks by hired mercenaries have become the order of the day.

Despite the reports of various civil liberties organisations on repression of people's movements in the past year and more, the Andhra Pradesh government is continuing to let loose terror on the people and the activists. Worse, there appears to be a virtual black-out on what is happening in the area.

Unfair Dismissal of Journalist

V T RAJASHEKHAR SHETTY, senior staff correspondent of the Bangalore edition of *Indian Express* who had served the organisation for 14 years, was dismissed on April 26, 1979 on the charge that he was writing articles in journals other than *Indian Express*. The dismissal order cited an office note of April 11, 1978 stating that no journalist at *Indian Express* can write articles elsewhere without taking "written permission" from the Editor-in-Chief. A domestic enquiry was conducted and Shetty was dismissed, even though Shetty was contributing articles to other publications after having secured the written permission of the former Editor-in-Chief, Frank Moraes, way back in 1972.

At the domestic enquiry, the enquiry officer never challenged the written permission given to Shetty by the late Frank Moraes but in the dismissal order, the management cast doubts on its authenticity and credibility. It is to be noted that the original permission given by Moraes was not withdrawn by his successors; nor did Shetty publish any articles elsewhere after he was served with this show-cause notice in January 1979. Moreover, Shetty seems to have been especially singled out for persecution, for other journalists in the same office who too have been writing articles (and without any permission) have been left untouched.

Some progressive journalists of Bangalore have already written to the Indian Federation of Working Journalists, the Press Commision, the Press Council and other authorities protesting against this persecution of an innocent journalist. To this, we add our voice of protest and request all sympathisers to join in the protests.

The Scale of Disarray

Romesh Thapar

THERE'S no getting away from it any more. The Janata party is digging its grave with remarkable speed. It may survive as a conglomeration depending on the longevity of Morarji Desai, but already the coalitionist character of the party is getting emphasised from day to day. Individual ministers are also passing the buck, making known what they would like to do, but implying that their hands are tied. The effort to hammer out a minimum, time-bound programme is not even attempted to be made. Result: the scale of disarray is frightening.

George Fernandes, who holds a key portfolio, apparently realises that there is little point in lobbying through speeches, or private meetings, for decisions which will not be agreed to. In fact, he is unable to carry conviction with his colleagues, or the public at large. The gap between promise and performance creates the climate for charges of corruption. And the Cabinet meanderings do not help; the investigations into the Siemens "deal" naturally creates a suspicion of something at odds with established policy. Against this messy background, the minister's public espousal of the railwaymen's case for bonus is seen as a deliberate posture to organise a melodramatic resignation.

Biju Patnaik also commands a critical sector: steel and mines. Here, the disorganisation is so phenomenal that there is talk of letting the private sector in. This is the strangest of "magic wands", considering that the Government of India is now the repository of so many sick units that it might itself collapse of induced, contagious sickness. Any attempt by the wise men in the ministry to rationalise distribution of what have now become scarce commodities, is seen as inspired by corrupt practice; the Patnaik story is trotted out to prove the point. Endless calculations go on to estimate how many crores are passing hands. What effect all this fevered activity will have on puisne corruption is impossible to foretell.

Move into the gilded arenas of Petroleum and Electronics, you would think that the Government of India is today even more in the solid grip of the sons and sons-in-law of the mighty. Favours of every description are dictated to the secretariats. Any resistance meets with fearful retribution. We cannot blame the public for developing cynical responses to the commissions of enquiry and the special courts designed to book the offenders of yesteryear. The politicians are fast becoming indistinguishable where their habits and motivations are concerned. That's why the police have a whip hand in their countrywide agitations.

If Vajpayee and Advani are undistinguished, except in the realm of "speechification", the Mohan Dharias and Madhu Dandavates lack the capacity to confront deteriorating situations. Turn to other ministries like Tourism, for instance; they are busy wrecking the corporations on which the whole infrastructure is built. A parliamentary committee passes strictures on the alleged perks of public sector managers, but in the account books of every corporation exists extraordinary evidence of the monies spent on the "board and lodging" of these committees. Will some public spirited department or ministry of the Government of India place this information at the disposal of parliament.

We will never bring our present disarray into some kind of manageable focus unless we begin to batter down the populist model of political functioning, popularised by Indira Gandhi, and certainly not abandoned by her Janata party competitors. Morarji Desai assumes moral postures and pretends that he is above such things, but every one of his colleagues knows how he interferes in the smallest appointments, holds up schemes and projects because someone has whispered something to him at some time of the day when he has not been taking a nap.

There is exasperation about the prime minister's office and its functioning. Diplomatically, for example, there have been frantic enquiries about the newly designated "personal envoy" of the PM — Dinesh Singh, described by the mischievous as Mohammed Yunus-II! who worked out this nonsense trip through the ASEAN countries. They are sick of "big brother" gimmicks, in the style of the US President. They want some serious, official and responsible discussion on the problems of the region, and India's new responses to them.

The Dinesh Singh junket has, so far as observers in the Capital are concerned, not made sense to Dinesh Singh himself. Either he is playing a diplomatic role or not. We need to know. But from whom. Vajpayee is silent. So is Morarji Desai.

I could go on in this strain with endless examples to prove that the disarray is fatal. Morarji Desai — and, believe it or not, even his tortured colleagues in the Cabinet — would have us believe that we are making a proverbial mountain of a mole-hill, that this is the trouble with an irresponsible press now "enjoying" complete freedom, that the people must be made to realise that they are being misled, hoodwinked, bamboozled. It is an attitude of mind which is common to all those enjoying power in the subcontinent — the Janata, the Cong(I), the Cong(S), the AIDMK, the CPI(M), the Akalis and the coalitionists of various description. The more the disarrav, the more hardened this attitude of mind. Our politicians want to live in some fantasy world of perks and privileges even as they imagine they are carrying out an economic, political and social revolution in democracy.

Wherever we turn, the signs of the growing breakdown are visible. But the effort to return political life to some sanity is more-or-less non-existent. The sweet nothings of a Chandra Shekhar, or the familiar Communist lobbying by Madhu Limaye, or the authoritarian invocations of Indira Gandhi, carry little impact. The Indian has lived through too many experiences to respond to these images. Surely our politicians understand this. Then what is it that prevents bolder initiatives by a more powerful combination of forces? Communist rigidity? Jana Sangh/RSS fears? Do we not need to reorganise our federal polity: smaller states, decentralised power, a presidential system with appropriate checks, an electoral reform that would restore health to the Republic by 1982? At least, then, we could argue that these years were not wasted in attempting to preserve the rotten carcass of a corrupt, bureaucratic state.

June 9

Saved by Aluminium-for-Power Deal

Hansavivek

MADRAS ALUMINIUM has entered into an agreement with Andhra Pradesh government with the concurrence of the Tamil Nadu government, whereby it will barter during the current year 6,000 tonnes of EC aluminium for 120 million units of power during the summer months. In TN state now there is a power cut of 15 per cent for continuous process industries like aluminium. The company is, however, safeguarded to the extent of 25 per cent through the agreement with AP government. This has saved it from a disaster such as was being experienced in the past. The agreement is for two years lasting upto the end of 1980, subject to review at the end of 1979. Thanks to this agreement and the commissioning of the Tuticorin project during July 1979 which would add another 200 MW to the TN grid, MALCO should be free from the hazard of power cut to a considerable degree upto the end of next year.

During 1978, the company produced 23,117 tonnes of primary metal against 17,036 tonnes produced last year and the installed capacity of 25,000 tonnes. Sales have increased from Rs 13.87 crores to Rs 19.89 crores and gross profit has expanded from a mere Rs 31 lakhs to Rs 309 lakhs. After providing for depreciation, there is a profit of Rs 111 lakhs which has occurred after a break of three years. This profit is inadequate to clear arrears of depreciation for 1977, which has been deferred for adjustment against future profits. The company achieved improved profitability by selling higher quantities of more profitable items such as billets, CG ingots and alloys. Profits were high on CG ingots prior to October last, as their prices were not controlled. After control on prices of these ingots, the company laid more stress on selling other products to maintain profitability. Overhead expenses were reduced and interest charges lowered by return of loans made possible by cash generation. The company is implementing diversification projects for production of 2,000 tonnes of aluminium extrusions and 7,000 tonnes of continuous cast sheets. Both these projects are expected to be on stream by early next year. The company also has a programme to increase alumina production to 140 tonnes per day.

PEICO ELECTRONICS AND ELEC-TRICALS is the new name of Philips India. The company will soon issue to the Indian public 17,04,000 shares

of Rs 10 each at a premium of Rs 4 per share. At the same time, N V Philips' Gloeilampenfabrieken of Holland will offer for sale a part of its shareholding in the company. This will reduce the holding of non-resident shareholders to less than 40 per cent in compliance with FERA. The company also proposes to issue secured debentures of Rs 8 crores to public financial institutions to meet its financial requirements including those relating to expansion, modernisation and replacement schemes, which are intended to be undertaken. The company has been granted a 'letter of intent' for manufacture of high pressure sodium vapour lamps. The directors say that despite change in the name of the company, its products will continue to be sold under the 'PHILIPS' trade mark and emblem as agreed upon with the Dutch company, since they conform to the worldwide Philips quality standards. The company has turned out good results for 1978, with higher sales and profits. Dividend, raised from 14.6 per cent to 16 per cent, is covered 1.2 times by earnings.

NATIONAL RAYON CORPORATION, managed by government directors, has fared so well that it is not only clearing arrears of preference shares for 1976 and 1977, but is also paying an equity dividend of 10 per cent for 1978 as also the balance equity dividend of 18.80 per cent for 1973 which could not be paid then on account of restrictions imposed by the government on distribution of dividends. Sales have increased from Rs 40.41 crores in 1977 to Rs 45.60 crores in 1978 and gross profit has more than doubled from Rs 1.87 crores to Rs 3.98 crores. Such good results have been obtained despite lower production of the rayon division on account of labour unrest in the factory in July 1978. Production of rayon textile yarn was 8,554 tonnes as compared with 9,468 tonnes in the previous year and that of rayon tyre cord was 4,555 tonnes against 4,865 tonnes. Output of nylon tyre yarn increased from 560 tonnes to 1,310 tonnes, as plant and equipment installed under the phase II programme became operational. The industrial licence for production of nylon tyre yarn has been recently revised from 2,200 tonnes to 3,300 tonnes. The present fabric making capacity, however, is limited to only 50 per cent of the original yarn making capacity. The company is seeking government permission to increase its fabric making capacity to match the revised yarn making capacity. The first phase programme for modernisation of old rayon plants has been taken on hand. It has also been decided to diversify into manufacture of industrial preservatives and pesticides. The capital cost of these projects is estimated at Rs 5 crores. The company has applied for industrial licences. On legal advice, the directors lodged a complaint with the police about irregularities and illegalities committed by the former management. As a result, Sudhir N Kapadia, ex-chairman of the company, and some other persons were arrested and released on bail. Government of Maharashtra has appointed an eminent advocate as special prosecutor to conduct the criminal proceedings. The company has also filed suits against trustees of four trusts and the then concerned directors, *viz*, S N Kapadia, R N Kapadia, F L Berarwalla and R S Chowdhury, for recovery of "unlawful" donations amounting to Rs 8.50 lakhs.

GOETZE (INDIA) commenced commercial production of piston rings at its new plant at Bangalore towards the end of November last and achieved over 40 per cent of the installed capacity during one month's operation in 1978. The company expects to achieve 60 per cent capacity utilisation this year. The plant has a licensed capacity of 10 million piston rings per annum. Conventional cast iron piston rings apart, the plant will also manufacture special types of rings both in material and design including large diameter piston rings for diesel locomotive and marine applications upto 300 mm diameter, as against 150 mm diameter presently being manufactured by the company at the Patiala works. Due to great demand for special types and large size cylinder liners, the management has planned to set up facilities for production of such liners including hardened cylinder liners. A programme of renovation and rehabilitation of the Patiala plant has been drawn up. An additional four-tonne induction furnace is being provided there to meet the increased demand of molten metal. Also an additional line is planned for development of new type of rings. Increased production at Patiala and contribution from the new Bangalore plant has enabled the company to produce good results for 1978. Sales, profits and margins are all higher than last year. Dividend has been stepped down from 20 per cent to 15 per cent, which is payable on an enlarged capital.

DENA BANK registered significant progress in deposit growth and in credit disbursal to priority sectors in 1978. The bank opened 61 new branches during the year, taking the total number of branches to 765. Out of the new branches, 32 were opened in rural centres and eight in semi-urban centres. At the end of the year, 481 branches or 62.7 per cent of total were in rural and semi-urban centres. Total deposits of the bank rose from Rs 512 crores to Rs 614 crores in 1978, the rate of growth of deposits being 19.9 per cent which compares favourably with the average growth rate of 18.6 per cent registered by the banking system. Dena Bank's advances increased by Rs 42 crores in 1978, from Rs 358 crores to Rs 400 crores. Priority and neglected sectors were the recipients of the bulk of incremental credit. Advances to the priority sectors increased from Rs 101 crores to Rs 125 crores, thus registering a growth rate of 24 per cent. The share of priority sectors in the total net advances constituted 34 per cent as against 30 per cent at end of 1977. Dena Bank has thus achieved the target of 33.3 per cent share for priority sector advances in total advances well ahead of time. Agricultural credit accounted for 8.6 per cent of the bank's total advances at the end of 1978, advances to small scale industries for 18 per cent and advances to other priority sectors for 7.5 per cent. The share of advances under the Differential Interest Rates Scheme in the bank's total credit improved from 0.3 per cent to 0.53 per cent. Dena Bank has adopted the strategy of organising workshops and credit camps at different centres to encourage economically weaker sections to take up self-employment ventures. The bank organised 149 credit camps in 1978 and financial assistance of about Rs 7 crores was extended through these camps to about 10,000 small borrowers, one-fifth of whom belonged to the scheduled castes and scheduled tribes. Dena Bank's total income during the year was Rs 59.06 crores as against Rs 50.86 crores in 1977. Expenditure was Rs 58.35 crores against Rs 50.17 crores. After making necessary provisions, profits stood at Rs 70.3 lakhs in 1978 as against Rs 68.8 lakhs in 1977.

NEW DELHI

Hot Air on Public Distribution

B M

THE much-advertised expanded production-cum-public distribution scheme of Mohan Dharia, holding the portfolio of civil supplies in addition to external trade in the Union Cabinet, is ready to be launched from July 1. The scheme is claimed to have been given final touches at a conference with the state chief ministers and civil supplies ministers at the same time as the more pressing problem of coping with police unrest was discussed in the capital. In the context of a marked spurt in prices and thriving black market even while the traders too have chosen to take to the agitational course, direct intervention of the government in the market on the scale on which it is planned to be done will be widely welcomed. But the question is whether Dharia's scheme will really work for the purpose for which it is ostensibly designed.

In addition to foodgrains, the fair price shops registered under the scheme — eventually planned to total nearly three and a half lakhs — will handle a variety of items, among them tea, coffee, matches, toilet and washing soaps, exercise books for students, cheap cloth and kerosene. The state governments will be free to add to this list any other item they consider desirable. How exactly the problem of procuring and supplying all these items in adequate quantity, of reasonable quality and at competitive prices will be resolved, however, remains very much obscure.

Dharia when confronted with this problem said the other day that the government will not hesitate to impose a levy on producers and even take over their entire stocks to feed the system. But which producers did he have in view? The producers of the commodities proposed to be covered are farmers, except for controlled cloth and kerosene which are in the public sector. It is unthinkable that the system of purchasing agricultural commodities as a price support operation even while free movement and free trade are being encouraged will be altered to suit Dharia's scheme the logic of which postulates monopoly state trading in these commodities. Equally infructuous is likely to be his threat in respect of manufacturers of items such as matches, washing and toilet soaps, tea, coffee, salt and bicycle parts which are proposed to be brought within the ambit of the enlarged production-cum-distribution scheme.

Production costs and prices of commodities have a way of breaking artificial restraints and official policies have contributed in no small measure to raising their prices in order to promote their production by ensuring a "fair return" to the producers. These arrangements are bound to come into direct conflict with the idea of taking over stocks from producers, partly or wholly, at a fixed price which will be determined by the rival concept of "fair price" for the consumer. The only way to smoothen out the conflict will be to pump in more and more subsidies into the production-cum-distribution system being proposed by Mohan Dharia. This indeed is built into his entire scheme and if pursued on the scale proposed by him, it will indeed amount to subsidising sections of population having access to public distribution supplies at the cost of those, comparatively more vulnerable sections, who do not enjoy this facility.

Experience with the public distribution system to the extent it is being already operated should be taken into consideration before embarking on its expansion on the proposed ambitious scale. Besides bureaucratic inefficiency and corruption, a marked feature of public distribution has been the large-scale subsidisation both in procurement of supplies and their sale. As matters stand, the benefits of subsidisation tend to favour the viable sections rather than the vulnerable sections in whose name the public distribution system is ostensibly organised. This has been true even of foodgrains, not to speak of controlled cloth, sugar, kerosene or milk. The fact indeed is that public distribution has resulted in many cases in pre-empting commodities in short supply for consumption of selected privileged sections and areas, and, in the process, worsening the position of those, by and large vulnerable sections, who have to fend for themselves in the open market, both as regards availability and price.

The kind of ambitious public distribution system Dharia has conceived will also require commitment of resources — financial, managerial and administrative — which will be beyond the capability of the government to undertake in our system of mixed economy. It must also be realised that whatever resources are committed to trading will be that much resources diverted from investment in production which must occupy a higher priority at the present stage of our socio-economic development. A public distribution system, if it is to serve the right social and economic purpose must, therefore, be limited to a very few items of critical mass consumption, such as foodgrains, with emphasis on extension of its coverage to vulnerable sections rather than to increasing the number of items to be covered. Another direction for improvement of the system should be gradual withdrawal of subsidy except to the extent it is clearly earmarked for those below the poverty line.

Another idea built into the scheme is that the existing retail trade channels, in marked contrast to wholesale trading, should be substituted to a considerable extent by shops to be run by co-operatives and Panchayats and, finally, by the educated unemployed with financial assistance and credit at a preferential rate of interests from the nationalised banks. It would appear that priorities are getting mixed up here. Instead of generating new employment we are heading towards a massive displacement of those already self-employed by others who will, in addition, extract higher margins from their newly granted privileged position. This is bound to encourage a system of trading in commodities of mass consumption in sheltered conditions which will be ultimately at the cost of the consumer for whose benefit Dharia's scheme is claimed to be designed.

It is in the context of all these problems that the planners have been suggesting — but rather meekly, as is generally the case with their intervention in these politically difficult and uncertain times — that government should not take on more responsibility in the field of trading by seeking to cover more items than it can control with stocks in hand and where a measure of rationing is called for. They would prefer to confine this activity, therefore, only to wheat and rice, cheaper varieties of cloth produced in nationalised mills and imported edible oils. Dharia, on the other hand, though he found it necessary to caution the more enthusiastic chief ministers at the recent conference

against picking up items which are in short supply in the open market, wants the government to be involved in retail trading in goods which are even otherwise freely available at competitive prices in the open market.

Very relevant in this context, of course, is the reaction of the traders and the countrywide agitation being organised by them. The main demand of the agitation is abolition of the sales tax. But its real inspiration is the feeling that private trade is likely to be subject to some form or other of squeeze if any serious attempt is made to hold the price-line. The traders will feel cheated if the opportunities for making super profits which inflationary conditions offer are denied to them. There is evidence enough, however, that the spectre of inflation might induce the government to halt, if not reverse, its general drift towards lifting prices and distribution controls in some of the sensitive commodities. Interesting in this context, of course, is the influence that infighting among factions in the ruling party is having in prompting the traders to take the agitational course.

SCIENTIFIC RESEARCH

Paper Guidelines on Foreign Collaboration

IN its 167th Report, the Public Accounts Committee of the Fifth Lok Sabha had drawn attention to several aspects of biological warfare implications of some research projects with foreign collaboration. In a follow-up report (200th) the PAC provided further evidence in support of its apprehensions. The research projects mentioned by the PAC were:

(1) The Genetic Control of Mosquitoes Unit (GCMU Project).
(2) The Bird Migration and Arbo-Virus Studies at the Bombay Natural History Society.
(3) The Ultra-Low Volume Spray Experiments for Urban Malaria Control at Jodhpur.
(4) The Pantnagar Microbial Pesticides Project.
(5) Some of the research projects undertaken in Calcutta and Warangal in collaboration with the Johns Hopkins University.

This report briefly examines the action taken by the government in this regard after the findings of the PAC had been made available to it.

Despite being told by the Ministry of Health and Family Planning that it was not necessary to further enquire into the issue raised by the PAC Report, the Union Cabinet decided that a Committee consisting of the Defence Minister, the Petroleum and Chemicals Minister and the Health Minister should consider and decide the action to be taken on the PAC's recommendations. This Cabinet Committee in turn appointed a high-powered committee consisting of H C Sarin as Chairman and M G K Menon and M S Swaminathan as members to examine the PAC findings. By and large the high-powered committee gave a clear chit to the GCMU project. However, on some dubious aspects of the project where the evidence cited by the PAC was extremely significant, this committee too raised objections, albeit in an extremely mild way.

According to this committee, the GCMU research was directed primarily to assess "the operational feasibility" of the genetic control technique, and not immediately for disease-control. Only after successful techniques were standardised could these be used in the control of the diseases. It further notes that *Culex fatigens* and *Aedes aegypti* were two species which were technically easier to handle and breed, and considerable information was available on them, while *Anophgles stephensi* was known to be very difficult to colonise. "The choice of the first two species for experimentation in the earlier stage appears to be in line with the objective of the GCMU which was to assess the operational feasibility of the technique and not the actual control of the disease."

Regarding the working of the project, however, the committee expressed some reservations. In view of the fact that radiation sterilisation did not suffer from the disadvantages involved in inducing sterility by chemosterlisants, it was "not clear" to the committee why the first method was not used. The committee also noted that no special permission or government clearance was obtained to bring translocated strains of these mosquitoes species into the country nor was clearance sought from the drugs controller. Further "in their deep involvement and enthusiasm for the work, the unit appears not to have been sensitive to the implications of transmitting abroad or openly publishing the data relating to the mosquito population dynamics and vector susceptibilities".

The most significant aspect of the committee's finding is its reference to the widespread lack of consciousness about biological warfare implication of such research. "It is clear that there was no malafide intention on the part of the scientists and officials either at the signing of contract for the project or later in its progress, nor did the conduct of experts working on the project give room for any suspicions of biological warfare aspects. The fact, however, is that there was a lack of awareness of biological warfare aspects generally in the scientific community in India of which those concerned with the GCMU were but a small part."

In addition, the Committee also made some recommendations which are significant. These were:

(1) No research project on vector borne diseases should be undertaken with any foreign funds and personnel without scrutiny and without the specific approval at an appropriate political level.
(2) Even when such projects are indigenously undertaken the data should be cleared from the security point of view before publication. Further, whenever such field releases of mosquitoes or other vectors are proposed to be undertaken, the vector strains concerned should be specifically cleared by the Virus Research Centre, Poona, where facilities for this purpose should be created.
(3) Government should immediately set up a committee of scientists, administrators and legal specialists to chalk out in detail practices, procedures and associated policies for regulating the import of micro-organisms.
(4) The various laws on the import of hazardous chemicals should be immediately reviewed and regulatory mechanisms at the stages of importation, distribution and usages should be made more effective. Schedules and lists of these Acts should be reviewed periodically to include newer chemicals and materials. The executive function of the various levels of implementation of rules and regulations should be clearly delineated.
(5) All projects undertaken with foreign assistance should be examined from the point of view of national priorities and security before they are approved by government.
(6) In all scientific projects even when they involve international collaboration, the Project Direc-

[illegible] an Indian.

(7) In the GCMU project foreign post-graduates were brought in to the country to work as consultants to the Unit. This should not be permitted in any research project.

(8) In sensitive areas the work should be done exclusively by Indian scientists. However, if foreign consultants are essential for any phase of such project, suitable working procedures should be devised to ensure security.

In the above findings and recommendations of the high-powered committee, several points raised in the 167th and 200th Report of the PAC remain unanswered. For instance, nothing is said of the working being done at the Vector Control Research Centre, Pondicherry, where much of the GCMU staff shifted after the project was discontinued, or of the potential value which the information made available by the Project would hold for a yellow fever attack. The high-powered committee is equally silent about the role of US Public Health Service which had met the costs of this project and also retained exclusive power of veto over the appointments of the principal investigators.

Thus it is clear that in spite of the painstaking work undertaken by the PAC in mobilising a mass of evidence on some aspects of the security hazards of foreign collaboration, the subsequent action by the government has been concerned more with somehow sidetracking or suppressing the real, basic issues of concern.

The 200th report of the PAC had suggested adoption of certain guidelines for clearance of collaborative research ventures. Among these was one that specified that such ventures should not only be of 'potential value' for the country but also have immediate productive utility. But it now appears that while the government has reacted favourably to the adoption of the guidelines suggested by the 200th Report of the PAC, it has, however, made an exception regarding this guideline. Now, not only are ventures of 'immediate productive utility' open for foreign collaboration, but also those related to 'fundamental research'.

But even the most elaborate and carefully spelt-out guidelines, in themselves, cannot ensure that a research project involving foreign collaboration will always remain above board. Instances are even now not lacking of the most innocuous sounding research project being potentially capable of great mischief. For instance, in a recent project surveying the incidence of bonded labour some of the German collaborators collected blood, urine and blood samples in the Palamau district of Bihar which were then sent outside the country for further analysis. There have been other instances in the past of such samples being collected by US defence agencies, in all likelihood for biological warfare experiments.

Another recent example is the Indo-US tie-up to study Indian weather — part of Monex-79. According to a UNI report dated December 27, 1978, "The Indo-US tie-up will cover the Arabian Sea, the Indian Ocean and the Bay of Bengal to record as many meteorological observations as possible. The US will fly the gear-equipped airplanes. Indian and US scientists will also measure what goes on in the turbulent lower part of the atmosphere, analyse dust outbreaks over the Bay and the Arabian Sea during the monsoon and monitor the characteristics of rainfall associated with tropical depressions in the Bay". Is it advisable to permit this kind of collaboration with its weather warfare implications, especially in view of the fact that part of this project would also reportedly involve flights by sensitively instrumented American Navy reconnaissance planes over the Indian territory along the north and the north-eastern borders?

Yet another dubious research project is the one under which a unit of the Smithsonian Institute (a known collaborator of the US Department of Defence and a partner, from 1967 onwards, in the bird migration studies in India whose biological warfare implications have been exposed) based in the Hamis and Matho monasteries of the highly sensitive region of Ladakh is making an anthropological film. The clearance readily given to such dubious projects would indicate that the guidelines on security aspects of foreign collaboration often exist only on paper and are not always followed in actual practice.

THE MADRAS ALUMINIUM COMPANY LIMITED

MALCO

Registered Office: Mettur Dam - 636 402

Highlights of the speech of Shri C.G. DEVAYA, MANAGING DIRECTOR, delivered at the 19th Annual General Meeting held at the Inauguration Hall, MALCO Campus, Mettur Dam on Saturday, the 9th June 1979.

This is the first meeting at Mettur with the shifting of the Registered/ Head Offices from Coimbatore. We moved in here to operate closely with the manufacturing department to solve the many problems we have. Old scores had to be forgotten and new friendships formed. A new philosophy of togetherness had to be imbibed. This has worked out well for your company.

PERFORMANCE

After a lapse of a few years your company has been able to earn a net profit of Rs 1.11 crores during 1978, after the provision of Rs 1.9 crores for depreciation for the year. Unfortunately, this is however inadequate for the declaration of dividend as previous year's arrears of depreciation have to be cleared.

The production achieved at 23,117 tonnes of aluminium with a total turnover of Rs 20.99 crores was the highest ever reached comparing against the previous best of 18,968 tonnes with a total turnover of Rs 15.44 crores. The Tamil Nadu Government was good enough to provide a steady demand load of 67 MVAs throughout the year. If 7 more MVAs would have been provided we could have achieved 24,000 tonnes Low controlled prices and likely power cuts continue to be our main problems.

CONTROLLED PRICES

The low controlled prices are hurting us very badly. A new pricing policy was announced by the Central Government in October, 1978. Dual pricing has been abolished. New retention and selling prices have been established. The increases given for Malco at Rs 8,820/- per tonne (basic) for EC ingots and Rs 9,155/- for EC rods are inadequate with the cost of production spiralling up. Even at 92 per cent capacity utilisation during 1978 there was a loss of Rs 50 lakhs on the sale of controlled metal due to low controlled prices. This loss was made up through the sale of non-controlled metal such as CG ingots, rods, billets and alloys to achieve the profits during the year.

There has been further increase in the Tamil Nadu State in the power tariff by 4 paise per unit amounting to a cost increase by about Rs 800/- per tonne of aluminium with effect from 1/5/79. With the increase in the cost of the other inputs, low retention prices and the price control on CG ingots, we are operating at a serious loss with effect from May, 1979. There is urgent necessity for the retention prices being increased.

Shri C G Devaya

Due to the shortage of aluminium, 70,000 tonnes of metal will be imported by the Central Government during 1979. The ruling FOB International price of aluminium EC ingots is about Rs 13,000 per tonne (basic). There is world wide shortage even at this price. Where then is the justice of Malco obtaining only Rs 8,820/- per tonne of EC Ingots? If, for instance, the company were to be permitted to export part of the production, high profitability would be immediately ensured. We have not been asking permission to export. This is only an illustration for justifying higher retention prices. We need adequate profits. Besides paying dividends to shareholders, the plant is to be modernised and expanded so that the full potention of Malco can be exploited. These aspects have been seriously neglected in the past.

We have represented all the above facets to the Ministry of Mines & Metals and the Bureau of Industrial Costs & Prices. It is our impression that they are fully sympathetic to Malco's needs. We are looking forward to quick justice so that the wheels of a vital industry may not grind to a halt. We have suggested sanction of an interim increase of at least Rs 1,900/. per tonne. This is now needed as 'Oxygen for a patient in distress'.

ELECTRICITY

During the end of 1978 a barter deal was made with AP Government with the blessings of the Tamil Nadu Government regarding the supply of power during the year 1979 and 1980 Through a trilateral agreement, 6,000 tonnes of EC metal is being supplied annually to units nominated by the Andhra Pradesh Government in return for 120 million units of power to be supplied to Malco through Tamil Nadu Government during the lean summer months. Through this agreement it has been possible to obtain exemption from the 15 per cent power cut recently enforced by the Tamil Nadu Government with effect from 27th March 1979. Power cut is the deadliest of our hazards and this strategy has done us well. I am sure you would wish me to convey your special thanks to the Governments of Tamil Nadu and Andhra Pradesh for enabling this arrangement to be finalised and in particular to the Minister for Electricity of Tamil Nadu Government and the Secretary, PWD and Chairman of TNEB. This agreement would enable the Andhra Pradesh Government to carry out their electrification projects with greater speed. For Malco, the loss would have been about Rs 50 lakhs due to power cut even upto June 1979. But this has been averted through this barter agreement.

The matter regarding the Tamil Nadu Government's claim for Rs 95 crores towards excess consumption of electricity still rests with the High Court. We look forward to a just decision. A grave situation arising out of misunderstanding needs to be put right through wisdom on all sides.

The scope for the expansion of our primary metal capacity from 25,000 to 31,000 tonnes is under discussion, with Andhra Pradesh Government having informally agreed in principle to consider supply of this power on a barter basis. We have the electrical conversion equipment and the investment would be only about Rs 4.5 crores for increasing the capacity. It would be necessary to obtain the approvals of the Tamil Nadu Government and the Financial Institutions for going through these expansion projects, which would move Malco towards being an economic unit.

Diversification and Expansion

We have taken up the following projects in the first stage as part of your company's strategy to improve our viability.

Aluminium extrusions (2,000 tonnes per annum).

Continuous cast sheets (7,000 tonnes per annum).

Production of alumina in the higher rate (150 tonnes per day).

The necessary loan assistance of Rs 290 lakhs has been obtained from the Financial Institutions. The extrusion press has been shipped from USA, Texas during the end of May. We should be in production of extrusions by end 1979.

The continuous casting machine and allied equipments to be obtained from France would be commissioned during early 1980. It is the intention to integrate the continuous casting project with yet another new project for the production of cold rolled sheets in view of the profitability. For this supplementary project a further loan assistance of about Rs 5.5 crores would be required.

The increased production of alumina will be achieved in early 1980.

Research and Development

It is planned to extract about 300 kilograms of gallium annually from the sodium aluminate liquor. This project is in collaboration with NRDC and the pilot plant has been successfully established at the CECRI, Karaikudi.

Cost Reduction

This has been achieved through reduction in the cost of raw materials and engineering stores through broad based competitive purchases. Further cost reduction is planned through fuel oil substitution by producer gas for lowering the cost of steam and installation of mini computers for automatic voltage control to lower electricity charges in the smelter.

Assistance Obtained

The Financial Institutions have specially expedited the process of making the finances available. This has speeded up the progress of projects. Our Bankers, Indian Bank and State Bank stepped in to assist us on each occasion when there was need. The Central Government and Tamil Nadu Government, on their part have assisted Malco in its various programmes for improving our operational efficiency. My colleagues in your Board have rendered valuable guidance based on the rich experience that the individual members of the Board possess.

Our collaborators M/s Alumetal, SPA, Milano have continued to render excellent technical support to ensure the growth and viability of Malco.

Your Company greatly appreciates the very valuable assistance obtained from the above agencies.

Our Customers

The earlier policy has been to supply metal on the basis of the past off-take by our customers. With the barter agreement with the Andhra Pradesh Government the metal had to be supplied on priority to the units nominated by the AP Government as also the units nominated by the Tamil Nadu Government, who supply power at subsidised rates. I could only apologise to our good customers and tried to explain that power cut had to be somehow averted. This was the only alternative to Malco for sheer survival through optimum utilisation of the capacity. The Central Government was also not happy at first as this conflicted with their guidelines for the distribution of the metal. The realisation that the barter agreement with the Andhra Pradesh Government has resulted in the normal production of metal by Malco during the power cut in Tamil Nadu during summer of 1979, would have enabled the position being better appreciated.

Employees

The decision to shift the Registered and Head Offices of the Company in the interests of the efficiency has inconvenienced 40 families who had to move from Coimbatore to Mettur. The staff have co-operated greatly in the interests of the company and this deserves your special appreciation.

Our employees, workers and the supervisory staff, at all levels, have played their role with particular emphasis on higher efficiency and improved productivity. The labour relations have been good without any impediments to production. There have been of course, the dialogues and discussions, all well within the accepted norms of collective bargaining. During 1979 a better deal has been given to the staff and workers through recent settlements. This has been possible, thanks to the good performance of the company. I would like to specially commend to you all the employees for their excellent performance.

Managing Director

As you would have seen in the press there has been considerable propaganda and certain unusual events in the High Court and elsewhere. The Company Law Board's sanction for my continued appointment beyond 20/3/79 had been questioned. The temporary injunction order by the High Court, issued on a writ petition from a shareholder, restraining me from acting as Managing Director was since vacated. In the circumstances in which I was appointed, perhaps, there is bound to be power politics and certain efforts to displace me. This has been accepted by me as part of the game. It makes an interesting study. On my part, I have concentrated on doing my best for the well being of your company, with the support of your Board and the employees.

1979

The trend for 1979 which was satisfactory until April has been adversely affected due to the higher power tariff from May, 1979 as also the increased cost of inputs. This has to be solved only through the higher retention prices asked for. Several basic problems have been solved. Production is normal. Diversification is now a reality. The key for the viability of Malco, which produces the wonder metal of the modern age, is now very much in the hands of the Central Government. Given a fair treatment and with the spade work completed it should not be now far off for Malco to commence declaring dividends. I am aware of the impatience of the shareholders which is understandable.

Note · This does not purport to be a record of the proceedings of the Annual General Meeting.

	98,86,32,261		S. Rs	185,35,17,044.00				

NOTES :

1. Included in advances is a sim of Rs 1,54,32,085.04 due from a Textile Unit which has been nationalised. According to the Bank claims in respect of post take-over management liability have been lodged with appropriate authorities. Out of the above amount, the claims to the extent of Rs. 20,95,699.82 have already been passed in favour of the Bank, to to be realised for the compensation money payable to the owners of the Textile Units. But the Bank has filed an appeal against the decision and has claimed the full amount. The Bank has also filed suits against the Guarantors besides the claim referred to above In this context it has not been possible to ascertain the shortfall, if any, that may arise on final settlement of this claim and accordingly, no provision has been made in the account in respect thereof.
2. Reconciliation of various heads of inter-branch accounts both Indian and Foreign, are in arrears and many old items remain to be cleared for the past several years. At some of the branches details/balancing/reconciliation of accounts relating to Demand Drafts Payable. Drafts Paid Without Advice, Deposits, Advances, Balances with other banks including State Bank of India and foreign banks, etc, are in arrears. Further Suspense Account, Sundry Creditors, Clearing Account and Bank reconciliation statements at some of the branches include long outstanding items pending scrutiny and adjustments. Steps are being taken in this regard including strengthening up of internal control system.
3. Amount of Participation Certificates issued and outstanding was shown in the Balance Sheet as at 31st December, 1977 under the heads "Borrowings from other Banking Companies, Agents, etc." and "Advances". In the Balance Sheet as at 31st December, 1978 the outstanding amount of such Certificates is deducted from both these heads and the same is shown under the head "Contingent Liabilities"; previous year's figures have also been correspondingly regrouped.
4. Previous year's figures have been regrouped wherever necessary to make them comparable with those of the current year.

REPORT OF THE AUDITORS

To,

THE PRESIDENT OF INDIA

1. We have audited the foregoing Balance Sheet of Bank of Baroda as at 31st December, 1978 and also the foregoing Profit and Loss Account of the Bank for the year ended upon that date in which are incorporated the returns of 32 branches audited by us, 589 branches audited by other auditors, returns last received as at 30th June, 1965 only of the Narayanganj branch in Bangla Desh and unaudited returns in respect of 743 branches (including 1 foreign branch opened in October, 1978) not visited by us. The branches audited by us and those audited by other auditors have been selected by the Bank, in accordance with the guidelines issued to the Bank by the Reserve Bank of India.

2. The Balance Sheet and Profit and Loss Account have been drawn up in Form "A" & "B" respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly they disclose such matters as were required to be disclosed in the case of Banking Companies prior to Nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956.

3. Subject to the limitations of such disclosure as stated in para two and on the basis of the audit indicated in para one

   AND further subject to the limitation of the information furnished to us as disclosed in Note No. 2 and its implication on accounts and subject to Note No. 1 regarding non-provision in respect of the nationalised textile unit, we report that

   (a) in our opinion and to the best of our information and explanations given to us and as shown by the books of the Bank :—

      (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars, and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1978.

      (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the year ended covered by the Account.

   (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

   (c) the transactions of the Bank which have come to our notice have been within the powers of the Bank.

   (d) the returns except for the branch in Bangla Desh, received from the offices and branches of the Bank have been found adequate for the purposes of our audit.

Place : Bombay.
Date : 31st May, 1978

ALEMBIC GLASS INDUSTRIES LIMITED

Speech of Shri R. B. Amin, Chairman, Board of Directors, at the 34th Annual General Meeting of the Company held at Baroda on Tuesday, 12th June, 1979.

Ladies and Gentlemen,

I welcome you all to the 34th Annual General Meeting of the Company. The Accounts for the year ending 31st December, 1978 and the Directors' Report have been forwarded to you earlier and with your permission, I shall take them as read.

Your Company recorded another year of increased output and sales, in spite of a number of adverse and unfavourable factors affecting its performance. In our plant at Baroda, one unit feeding two lines of production was out of commission for some time because the furnace was being converted to a bigger unit which could eventually accommodate more lines of production. Two other units were also closed for short periods on account of repairs, particularly affecting the production of pressed ware, However, the overall output was increased from 42.9 thousand tons in 1977 to 45.4 thousand tons in 1978, on account of higher production at Bangalore.

Sales revenue crossed the Rs. 10-crore mark during 1978. At Rs. 10.5 crore for the year it was Rs. 1.17 crore i. e. about 12 per cent ahead of the sales figure for 1977. The intensity of competition already prevailing in the market further intensified because the overall capacity now established in glass industry is well ahead of the total demand. Prices are therefore constantly being depressed and margins are very narrow and unremunerative. Our operational earnings were eroded by exorbitant increases in the costs of energy inputs; for a power intensive industry like ours, this presented a massive setback and handicap. In Baroda, the price of natural gas was raised by the Oil and Natural Gas Commission, unilaterally and arbitrarily, by 32 per cent, at one shot, from Rs 382.15 to Rs 504.00 per 1000 cubic metres. Thus, for more or less the same throughput as last year, your Company had to pay Rs 22 lakhs more. Power rates went up for our Whitefield Unit as well; the new tariff means an increase of 70 per cent and the power bill in the year under review is higher by about Rs 20 lakhs over that in 1977. You will agree that this kind of one-sided, abrupt and unequal business behaviour shown by government monopolies is most unsatisfactory. The existing government monopolies for coal and oil should be broken up and there should be several agencies to produce and supply. Without decentralisation through de-nationalisation and devolution for all government monopolies in our economy such as in railways, airways, banks, insurance, steel, coal and oil etc, the economic picture for the future is very dark indeed. Irregular and insufficient supplies of soda ash added to the problems of the industry. Costs of various papers and boards for packaging increased substantially during the year. Other costs and expenses also went up and although considerable economy was enforced and achieved, the profitability of your Company was adversely affected by the simultaneous impact of these various factors.

Another basic factor which chronically, continuously and relentlessly handicaps the development of glass industry and saps its potential for growth and contribution to the improved standard of living of our people is Excise Duty. Because of the ease with which it can be levied and collected, it is being imposed and augmented in a manner in which it has become a major constraint on increased production of many industries; equally and simultaneously, it has put so many goods and services beyond the reach of our people because the tax element is so heavily loaded in the prices of most articles meant for day-to-day consumption.

Excise rate of 35% on glassware is excessive and counter productive in as much as the glass container is an input for other user industries such as, food and beverage processing industries, dairies and pharmaceuticals which in turn, provide for daily necessities for the people. Alternatively, these wares and containers are bought by households. By no stretch of imagination can articles like glass tumblers and bowls etc, be regarded as luxuries. The final price for the consumer is heavily loaded by the excise elements of all inputs upto the manufacturing stage of glass containers, and the subsequent excise element on the glass container itself, along with other inputs which go in to make up the final consumer pack as in beverages, pharmaceuticals, processed food articles and so on. As it is, raw materials such as soda ash and oil or electricity going into the basic manufacture of glass bear sizeable excise duty or cess. At the other end of the chain, where all glass containers necessarily require to be packaged for onward carriage, packing materials are already subject to prior excise levy under different heads. As a result, there is a progressive build-up of costs marking up the price to the consumer. The products of the glass industry and the user industries connected with it, are thus going beyond the reach of most consumers. The inherent strength and contributive capacities of both the glass industry and the user industries in respect of a better life for our people, are made to suffer and languish. For the consumer, any increase in excise duty is also inevitably accompanied by the additional loading of other taxes such as octroi, sales tax etc, so that the excise rate of 35 per cent on glass ware would ultimately end up as about 50 per cent. With this sort of excise burden at every stage, how do we expect to raise the standards of consumption of the general public and to satisfy their modest aspirations for a little more sparkle in their lives? This approach to indirect taxation involving very high excise rates at each step of manufacture can only damage the fabric and enervate the performance of the national economy. We would urge Government to give serious consideration to these dangers inherent to our national economy in the cascading effect of excise and so on.

The best solution would be a tax on added value. If we have to persist with multipoint excise at each stage as we are having now it has to be very low rate; in no case should it exceed ten per cent. If this approach is adopted, the entire economy will be energised; there will be greater production, employment and well being and there will be an automatic check on inflation. At the same time, the overall revenue accruing to government from excise will be more and more progressive.

Before I conclude, I place on record my appreciation of the hard work and efforts made, during the year under review, by the managers as well as the staff and workers at Baroda and Bangalore. I also thank my colleagues on the Board for their counsel, assistance and co-operation.

I now commend, for your consideration, the Directors' Report and the Annual Accounts of the Company for 1978.

Note: This does not purport to be a record of the proceedings of the *Annual General Meeting.*

Indian Overseas Bank

IOB's Performance in 1978 in Brief

Nineteen Seventy Eight proved to be another successful year for Indian Overseas Bank in its operations both in India and abroad. The Bank achieved significant growth in many important areas.

Deposits-Global

The Bank's global deposits and other accounts at Rs. 894.6 crores witnessed a handsome growth of Rs. 239.3 crores (or 36.5%) against Rs. 185.4 crores in the preceding year.

Deposits-India

Aggregate deposits in India grew by 37.5% (or Rs 213 crores) against the growth rate of 22% achieved by the banking system.

Rate of growth-Deposits

Indian Overseas Bank maintained, for the fourth successive year, its record of highest rate of deposit growth among the nationalised banks. Over the last four years, the Bank's deposits in India expanded 3½ times to reach Rs. 780 crores as of end 1978. IOB's share in all-bank deposits improved from 1.5% in 1969 to 2.7% in 1977 and further to 3.1% in 1978. Success on the deposit front has been achieved in the face of lower interest rates, decelerated branch expansion and severe competition both from within the Banking industry and from non-banking financial institutions.

Deposit Mix

A feature of deposit growth was the sizeable contribution from Savings and Current deposits. Together they were responsible for half of the incremental deposits during 1978 – Savings 31.5% and Current 18.5%. The share of Savings in total deposits edged up from 23.6% (end 1977) to 25.7% (end 1978) and that of Current from 13.7% to 15.1%. With Term Deposits accounting for only half of the additional deposits mobilised, their share in total dropped from 62.7% to 59.2%.

Rural & Semi-urban Deposit build up

Deposits at rural and semi-urban branches rose by 43% during the year against 39% in the preceding year. Their contribution to total deposit increment was nearly one-fourth. As of end 1978, rural and semi-urban branches were responsible for about 23% of the Bank's deposits in India.

Deposit Accounts

The customer growth as reflected in the number of deposit accounts was satisfactory. The addition during the year was 3.8 lac accounts.

Credit Global

Gross credit of the Bank on a global basis rose by Rs. 133.6 crores or by 31.6% to stand at Rs. 555.2 crores.

Credit-India

Gross credit in India, increased by Rs. 100 crores which is about 28% over the previous year.

Priority Lendings

Priority sectors claimed 37.3% of incremental growth. Priority credit stood at 33.7% of total lendings against the stipulated norm of 33⅓%. Outstanding advances to priority sectors improved from Rs. 117.5 crores (end 1977) to Rs. 154.7 crores (end 1978) — an increase of Rs. 37.2 crores (or 31.6%) well above the 1977 increment of Rs. 30.1 crores. Total lending accounts under priority sectors as of end 1978 numbered 4.22 lacs.

Rural Credit

Agricultural credit recorded a sharp growth of 43%, raising the total level of farm credit to Rs. 71.6 crores. The share of farm lendings in gross credit at 16.6% as of end 1978 was one of the highest amongst public sector banks. Half of the direct agricultural advances were made to small and marginal farmers, who held the bulk (68%) of the bank's total farm borrowal accounts. Nearly 3 lac farmers have received credit so far for both production purposes and for subsidiary occupations.

In the sphere of village adoption, the thrust during the year was on ensuring all-round development of villages by provision of credit and other services, and wherever necessary, by involving government authorities and voluntary agencies. The number of villages and hamlets adopted till end 1978 was 383; the average number of farmers financed in each village/hamlet was about 80.

Lendings to Small Scale Industries

Moderate progress was registered in extending credit to the small scale industries. Total outstanding advances increased by Rs. 7.3 crores or by 16.5%, to exceed the Rs. 50 crore mark. As on end December 1978, lendings to small scale industries formed 11.2% of gross credit. The number of small scale units financed increased by 3,283.

Finance for Employment Promotion

Good progress was made in extending credit under various schemes designed to assist the employment-oriented sectors such as small transport operators, small traders and other self-employed categories. Aggregate outstanding advances to these sectors registered a 35% growth or Rs. 8.2 crores, the same as last year. Nearly 25,000 new borrowers including Harijans and Tribals received credit during the year. As of end 1978 the total number of beneficiaries under employment-oriented lendings has touched the one lac mark.

Export Credit

Export credit received a thrust during the year. Outstanding advances reached Rs. 39 crores against Rs. 28.0 crores a year earlier.

DIR Advances

For the third successive year, DIR advances remained above the 0.5% norm stipulated by the Government of India. As of end 1978 the ratio was 0.8%.

Rural/Semi-urban Credit/Deposit ratio

The credit deposit ratio in the rural/semi-urban sector was nearly 60%, taking into account the advances sanctioned by the Bank's urban/metropolitan branches to industrial units for factories located in rural/semi-urban centres.

Regional Rural Banks

The two Regional Rural Banks sponsored by IOB viz. The Pandyan Grama Bank (Tamil Nadu) and the Puri Gramya Bank (Orissa) made considerable headway. Between them, in a short span of about two years, they have financed about 64,000 small and marginal farmers and artisans.

Districts were launched early in 1978, for implementation from the beginning of April, 1978. The plans envisage a total credit outlay of Rs. 129.1 crores—86% for the agricultural sector. 9.8% to the industrial sector (including small scale industries), and the balance to the service sector. 60% of the Plan outlay had been disbursed before the close of 1978 as against the target of 75% for the year.

IOB made an earnest attempt to fulfil the credit outlays accepted in the 137 non-lead districts. As compared with the cumulative credit allocation of Rs. 20.5 crores to priority sectors for the year 1978-79, lendings during April-December 1978 were of the order of Rs. 25.6 crores — 69% to agriculture, 17% to industries and the rest to the service sector.

The implementation of district credit plans and the financing of various schemes contained in the plans are being closely monitored so that it becomes an effective tool for the integrated development of the districts. District Industries Centres have been set up in five of the seven Lead Districts. The Bank has deputed senior officers to serve as credit managers at these centres.

Branch Expansion

52 new branches were opened in 1978—33 of them in unbanked rural centres, raising the total number of branches in India to 706 as of end 1978. 14 Extension counters were established during the year against 11 in 1977, taking the total number of Extension counters to 60. 63% of the bank's branches now operate in rural and semi-urban centres, against 43% on the eve of nationalisation — reflecting the tremendous diversification in geographical operations the Bank has achieved.

The policy of decentralisation of administrative machinery for the sake of efficient conduct of operations and to be as near the people as possible,

at 31st December 1978

received further stimulus during 1978. An additional Regional Office was opened at Chandigarh for better development and control. IOB now has 12 Regional Offices to coordinate branch activities within their command areas.

International Business

The Bank's international business continued to grow substantially. The deliberate attempt made to get a bigger share of foreign exchange business was reflected in a growth of over 75% in the volume of merchant business handled. Apart from export/ *import transactions and other conventional services*, the Bank extended its expertise to international clients in the area of project financing, Euro currencies transactions etc.

Overseas Branches

The Bank's 10 branches abroad — 7 at Hong Kong, 1 at Singapore, 1 at Seoul, and 1 at Sri Lanka acquitted themselves creditably during 1978 as reflected in a 50% expansion in their combined resources. Their growth in key result areas being — deposits 20%, advances 39%, investments 68%, and profits 52%.

Profits

Net profits registered a 4.5% increase to reach the record figure of Rs. 3.77 crores. Ratio of profits to working funds continue to be the highest among nationalised banks.

Capital Funds

The ratio of capital funds to deposits, at 1.4% in 1978, is also the highest among nationalised banks.

Personnel

1978 saw an accelerated tempo of recruitment and training to sustain business growth. The intake was 2140 — 167 officers, 1552 clerks and 421 subordinate staff — against a total of 1840 in 1977. In line with the national policy, members belonging to Scheduled Castes and Scheduled Tribes were given due importance in recruitment. The Bank's personnel strength at the end of 1978 was nearly 13,100 against 11,115 a year ago. As many as 1177 officers and 1419 clerks were imparted in house training. 336 officers participated in courses offered by external agencies.

Customer Service

The quality of customer service extended by the Bank was constantly kept under review. For the convenience of customers Evening Banking facilities were introduced in a number of branches. Further, the Teller System came into being in many more branches. The Bank placed special emphasis on the "Savings Advisor" theme in a massive promotional campaign to better customer service.

UTTAR PRADESH

Fizzling Out of Traders' Agitation

K R Krishna Gandhi

THE traders' agitation in Uttar Pradesh which at one stage looked like becoming a major threat to the state government has fizzled out for the time being. The threatened 'Bharat Bandh' on June 5 by the UP Udyog Vyapar Pratinidhi Mandal (an organisation of the traders of UP only recently formed) turned out to be a fiasco after the compromise between the government and a section of traders. The traders' rally in Lucknow on the same day which was proposed to be converted to a meeting to be addressed by the chief minister did not take place at all. In the Ravindralaya Hall where after quite a bit of confusion a meeting was held, the leadership was sharply divided and no future programme of action was announced. The 10-day state wide agitation thus ended on a note of confusion.

The agitation began on May 26 in Lucknow when the special survey squads of the sales tax department were attacked by traders following the sealing-off of a shop for inspection in the Aminabad Market. As soon as the shop was sealed, traders of the nearby shops collected and chased the survey squad which took refuge in the Aminabad police station. The crowd of traders surrounded the police station and started throwing stones. The police in a bid to disperse the crowd lathi-charged first but later resorted to firing. Soon the trouble spread to other parts of the city. The Kaiserbagh bus station was attacked and about two dozen buses damaged. Two jeeps of the sales tax department, one UP roadways bus and one mail van were set on fire. Attempts were also made to set on fire a post office and branch offices of the Andhra and Canara banks. Curfew was clamped down on the disturbed areas of the city following these incidents.

More than 100 persons, including some policemen, were injured in these incidents. Large scale arrests were made to bring the situation under control. The President of the UP Udyog Vyapar Pratinidhi Mandal, Lala Vishwambhar Dayal Agarwal then gave a call for an indefinite UP Bandh to protest against the police firing and to press for the abolition of sales tax. The death of Harish Chandra Agarwal, hurt in the May 26 police firing, on May 28, added an edge to the agitation which spread fast to other cities of the state.

The abolition of sales tax had been one of the election promises of the Janata party and one of the major damands of the former Jana Sangh. The traders demanded a judicial enquiry into the incidents of May 26 in Lucknow. They were supported in this by most of the opposition parties and by leaders of the former Jana Sangh (at present excluded from the state cabinet headed by Banarasi Dass). Government categorically rejected the demand for sales tax abolition on the ground that such a measure could be taken only by the Centre. The state's finance minister Madhukar Dighe (of the former BLD) clarified in the assembly that the survey squads were formed last year by the previous government headed by Ram Naresh Yadav. He went on to give some figures regarding the survey work done so far according to which discrepancies were observed in 90 per cent of the cases surveyed, the sales tax evasion being of the order of Rs 40 lakhs.

By May 30, the traders' hartal had spread throughout the state with hartal being observed in district headquarters and small towns also. In Lucknow it was the fourth day of hartal. The traders' agitation by now began to show signs of becoming a political struggle between the former Jana Sangh and BLD factions of the Janata party with the demand raised for the dismissal of the finance minister from the cabinet. The Janata Yuva Morcha (Youth wing of JS) organised processions in district headquarters while pressnotes were issued by leaders of the former Jana Sangh supporting the traders' demands. In Delhi two prominent Jana Sangh MPs, Kanwarlal Gupta and Shivnarain Sarsonia, demanded a judicial enquiry into the police firing, and requested the Janata party president to direct chief ministers of the Janata state governments to abolish sales tax. It may be mentioned here that Kanwarlal Gupta is actively associated with the Akhil Bharatiya Vyapari Sammelan now being formed.

On the other side, in the BLD Camp, Raj Narain appealed to the people not to allow the traders to take undue advantage of the situation. Ram Naresh Yadav accused political organisations of trying to create violence in the name of traders' agitation. The UP finance minister warned the traders of punitive action if they did not withdraw the hartal.

On May 30 the chief minister announced the withdrawal of hartal by traders. A probe into the Aminabad incidents by the Divisional Commissioner, Lucknow, and the suspension of the work of the special survey squads for one week was ordered.

However the president of the UP Udyog Vyapar Pratinidhi Mandal has denied that the hartal was being withdrawn. Such a withdrawal would be decided by the executive council of the Mandal on the basis of the talks with the chief minister. The executive council of the Mandal met the same day, but, no decision was taken. The decision was postponed to June 1, according to a spokesman of the Mandal. Meanwhile the hartal was to continue as before.

On May 31 the truck operators of Kanpur, the biggest commercial and transport centre in the state, joined the hartal thus further aggravating the already grave situation. A procession of traders on motor cycles and scooters was also taken out. In the meeting held in the evening the president of the Mandal announced that strike would continue till sales tax was abolished and the finance minister removed from the ministry. The chief minister countered accusing vested interests among the traders of sabotaging the compromise and refused to have any further talks with the traders. He said that action would be taken against the traders if they continued their hartal.

The executive of the Mandal met on June 1 and announced the decision to continue the state wide hartal till their demands were met. A call to traders in other states to observe 'Bharat Bandh' on June 5 was given. The following day, early in the morning, the president of the Mandal and 24 other top leaders of the traders were arrested in Lucknow. It was announced that no permission would be given to stage the rally in Lucknow on June 5, called by the Mandal. Arrests were also reported from the other important cities of the state.

Following the arrests, traders gradually began to open their shops in Lucknow and other big cities. A major factor acting as a pressure on the traders was the fast decreasing sympa-

thy of the public to this hartal. Even among the traders, petty shopkeepers, panwallahs, and thela wallahs whose participation in the agitation was low were actually forced to close their shops because they ran out of stocks. Meanwhile a number of trade unions and a section of the students publicly came out against the hartal. All this led to a division among the leadership over the direction the agitation should take.

On June 4, a section of the traders led by Jagdish Arora, the General Secretary of the UP Mandal met the chief minister and a compromise was arrived at. According to this all the arrested traders other than those directly involved in the violent incidents were to be released the next day and the work of survey squads suspended till further notice. Action against the Assistant Sales Tax Commissioner and the Lucknow City Magistrate as demanded by the traders would be taken only on the basis of the enquiry to be conducted by the Divisional Commissioner of Lucknow.

The news of the compromise had spread by the evening to most parts of the state. In the nearby Kanpur and certain other towns the compromise was denounced as a move to sabotage the traders' agitation and arrangements were made as scheduled to go ahead with the plan for rally in Lucknow. From Kanpur itself some 2,000 traders left for Lucknow to join the rally. On June 5 morning contingents of traders from various parts of the state had assembled in the Begum Hajrat Mahal Park in anticipation of the meeting previously announced. They were astonished to find no preparations for the meeting. The shops in Lucknow were all completely open while in most other cities there was complete hartal. There was confusion all around with the traders coming from outside finding no one to welcome them and guide them. Finally a meeting was held in the Ravindralaya Hall where the traders from Kanpur mounted a bitter attack on the Lucknow traders and demanded apology from the General Secretary of the Mandal. The compromise was described as a total surrender. The meeting ended with no announcement of future plan of action.

By the morning of June 6, most of the arrested leaders were released even though some traders claim that the real leaders are still in jail. The President of the Mandal has announced that the agitation would continue with the traders adopting new methods like not collecting sales tax from the public and not paying it to the government. However divisions in the leadership are still persisting, and for the time being, there is unlikely to be a fresh threat from the traders.

BOMBAY PORT

Labour Made the Scapegoat

Gayatri Singh

THE problem of congestion in Bombay Port has been receiving a great deal of publicity in the Press. Even *Washington Post* named Bombay port as "the worst in the world". The average waiting period for ships has indeed gone up to about 50 days. The waiting period for container ships too (which occupy a berth for hardly more than a day) has gone up to about 10 days. Severe congestion in the port has caused interruption of crude oil supplies from Iran, slowing down industrial activity in the Thane area. Ships registered at Bombay port are having to be diverted to other ports. Rapeseed tankers, for example, are being diverted from Bombay to Calcutta. Reportedly, in early March this year, the line-up of vessels waiting to be berthed was as follows: 62 vessels idling in stream: 1 carrying cement, 3 carrying edible oil, and 3 carrying fertiliser. Those registered and sent to other ports numbered 49. The problem has been aggravated over the last few years. Whereas in 1976 the *longest* wait was 41 days, today the *average* wait is about 50 days.

The port authorities and the government, while expressing their concern at the situation, are prone to blame labour. The shipowners lament the losses they incur on account of congestion. Each ship idling in stream, waiting berthing, loses Rs 30,000 per day. The demurrage payable to the BPT is as burdensome. Losses to the economy due to congestion in the port have been claimed to be Rs 500 crores in 1977-78, and the losses due to ship-days lost in the same year at Rs 20 crores.

Bombay is India's premier port. It handles more cargo than Calcutta and Madras put together. The port is said to have handled cargo estimated to be 15.59 million tonnes in 1978-79 (as compared to 6.3 million tonnes in 1947) and made a net surplus of Rs 4.91 crores.

While acknowledging the gravity of the problem, given Bombay's primacy as a port, it has to be underlined that the two main reasons for the congestion are poor administration and an exceptionally poor policy towards labour.

Poor administration affects the port in a number of ways. There is, for instance, the cargo spillout from the warehouses which chokes the docks. Reportedly, early this year, nearly 2,000 containers, each of an area 20 metres square, were scattered all over Indira Dock. While the total capacity of sheds and warehouses is 46,000 tonnes, the sheds are overflowing with about 60,000 tonnes of cargo. Apparently, the consignees do not pick up their goods quickly enough from the port godowns and warehouses because the Bombay Port Trust rates are actually lower than those of the commercial godowns and warehouses. Naturally, cargo not cleared in time slows down the movement of trucks, discharge of goods and the subsequent berthings. All this increases the turn-around time of ships.

It was only when congestion in Bombay port got much publicity that the government issued instructions to the port trust, asking them to require that consignees lift their cargo within seven days. Thereafter, government threatened, their cargo would be auctioned.

Cargo spillout from the warehouses causes chaos in many ways. As there is very little space for the systematic dumping of cargo, import and export cargo is often stacked one on top of the other and get mixed up. Cargo stacked on the roadways outside the godowns hinders loading and unloading operations and hence, prevents free movement of ships. Cargo, such as asbestos bags, stacked in the open are frequently run over by trucks and torn open.

Moreover, cargo spillout increases the chances of accidents. Every accident results in suspension of work or slowing-down of operations. Cargo is not supposed to be stacked near the side of a ship. Yet this safety regulation is blatantly ignored. Not only is cargo stacked near the side of ships, it is also stacked very near the cranes and at times directly under them. Indeed, every available corner is used up. The book of rules and regulations relating to dock safety seems to have been thrown into oblivion.

Containers off-loaded from the holds have first to be put onto the shore by

wi[illegible] [illegible] up by giant fork-lifts and placed onto the trucks. In no circumstances is a winch driver supposed to place the container (which invariably weighs more than 30 tonnes) directly onto the truck, because being on the ship he cannot see the truck clearly and the slightest misjudgment would result in the crushing of those on shore. Cargo sprawled all over the shore makes it impossible for the winch driver to follow this elementary safety rule. Numerous accidents have resulted from this.

Obsolete equipment is one of the main reasons for the slow loading and discharging of cargo. In March this year, the Industry Minister said that "the handling of cargo was done by outmoded cranes and mechanical gears. About 66 per cent of the gears were operational and half of the mechanical gears were available out of which two-thirds were operational." Besides, the winches were worn out. Winch and crane cables are generally frayed. Hydraulic cranes are continually going out of order. Crores of rupees worth of modern equipment lies rusting owing to administrative shortsightedness. For the last five years, expensive and modern cranes, purchased from Jessop, for over Rs 1 crore, have been lying rusting in 13 Indira Dock. The port authorities have refused to pay the crane operators the extra charge demaned for operating heavy lifts (loads greater than 5 tonnes — in this case upto 15 tonnes). Of the other cranes 50 per cent are out of order at any time.

There are no facilities to receive container or modern LASH ships. Expansion of Indian shipping has been too tardy to catch up with the demands of traffic — not to speak of the worldwide trend towards development of large vessels supposed to cut unit costs. Oddly, labour is being blamed for even these failings over which it has no control whatever.

Current customs procedures, which require all sorts of cumbersome procedures, of examination and verification, also cause delays in cargo movement. Testing of import cargo is a good example of red tape in the customs department. Import cargo requires laboratory testing and analyses prior to duty assessment, and this requires five to six days if local customs authorities are competent enough to carry out the testing. If, however, more comprehensive testing is required, it has to be carried out in Delhi. In many cases such import shipments cannot be cleared from the docks until the chemical testing has been cleared. Meanwhile, import cargo must remain in the docks — leading to congestion and impeding full utilisation of docks and sheds.

There are a very large number of clearing agents in the port. Indian clearing agents are licensed by local customs authorities. The latter have not attempted any rationalising of the clearing agent function. A common rule of thumb applied by customs authorities seems to require merely that the clearing agent possesses two import or export documents per month in order to have his annual licence renewed. The surfeit of clearing agents is not a help to clearing efficiency.

Night navigation as a means of reducing congestion has been ruled out by the port authorities because a large number of fishing vessels operate in the main channel. A study team report on the major ports of India by the 'International Association of Ports and Harbours' in July 1968, however, criticised this policy. It said that one of the express purposes of the Harbour Patrol Police was to prevent the obstruction of traffic by small fishing vessels, and that anyway "fishing boats and small craft were quite adept at avoiding large vessels transiting the main channel".

It is therefore most misleading to blame labour for the congestion in Bombay port. The fact is that, despite the congestion, the port labour handled 15.59 million tonnes of traffic in 1978-79 against a pre-estimated 14.86 million tonnes. This performance was possible because of the piece rate scheme, which has pushed up the intensity of dock labour to levels comparable to the highest in the world. The piece rate scheme was introduced in 1947. Before the introduction of the scheme it took 30 days to load a 10,000-tonne ship; today it takes five days. It is precisely this piece rate scheme that is responsible for the huge profit of the port. The current year's net surplus is estimated at Rs 4.91 crores. The port has Rs 100 crores accumulated in the bank and is earning sizeable interest every year. Nevertheless, beyond a point, the effects of using absolete equipment manifest themselves. Hence the present congestion in the docks.

Labour shortage is another important reason for the congestion in the docks. For example, the port has 22 pilots out of a sanctioned strength of 34, and 17 berthing masters out of a sanctioned strength of 19. They are thus overworked. It must be emphasised that the work of the port pilots is highly skilled, requiring the highest degree of concentration. By forcing the slender staff of pilots to work double-shifts, the management of the port is only increasing the possibility of accidents and crippling the operations. Several other categories of workers too are understaffed and overworked. The foremen and supervisors, for example, are often required to work excessive overtime, thus reducing their efficiency and slowing down work. Atrocious conditions of work compound this shortage, making efficient and relaxed working impossible. For example, labour, working on container vessels at night, work by the light of hurricane lanterns in this premier port city of India.

It is wrong, therefore, to view labour unrest, struggles and strikes as the *cause* of congestion. Precisely the opposite is true. It is the already existing congestion, coupled with high levels of intensity of labour, that leads to labour unrest.

Thus, on April 24, a foreman was killed and a contract labourer seriously injured when a container which was being lifted by a winch swung against them as they worked in the hold of the ship. While the contract labourer was covered by the Compensation Act, no such rules applied to the foreman as his salary was over that of the stipulated maximum covered by the Act. As the dead body was being removed to the mortuary, foremen and supervisors gathered around and asked the stevedoring company concerned to pay compensation on 'compassionate grounds'. This request was refused. What was at first a 'request' based on 'compassionate grounds' then turned into a 'demand' based on "workers' rights". A spontaneous agitation began resulting in a united strike of all foremen and supervisors. The entire port was closed down for two days. At the end of the second day, the stevedoring company relented under pressure — and signed an agreement for compensation.

From the very first day of the strike the leadership of the Transport and Dock Workers Union headed by S R Kulkarni sided with the stevedoring company. This was not unexpected. Indeed, the coincidence of interests, of the union leadership and the management of the stevedoring companies, is well known and widely discussed among workers. Therefore, despite it, the workers went it alone. In no circumstances could their demand be considered 'excessive' or 'unwaranted'. Incidentally, a contract labourer crippled for life in a simiar accident a few months ago was paid a 'compensation' of Rs 450 such examples are the rule. The Compensation Act is rarely observed.

Peasant Movement in Awadh

David Hardiman

Agrarian Unrest in North India, The United Provinces 1918-22 by Majid Hayat Siddiqi; Vikas Publishing House, New Dehli, 1978; pp xiv+247, Rs 60.

IN June 1920, Jawaharlal Nehru agreed to see a party of two hundred peasants who had walked to Allahabad city from their villages in Awadh fifty miles away. Jawaharlal later wrote in his autobiography of this meeting with the peasants: "They told us of the crushing exactions of the taluqadars, of inhuman treatment, and that their condition had become wholly intolerable. They begged us to accompany them back to make enquiries as well as to protect them from the vengeance of the taluqadars who were angry at their having come to Allahabad on this mission. They would accept no denial and literally clung on to us. At last I promised to visit them two days or so later." Jawaharlal went, and found the countryside of Awadh ". .afire with enthusiasm and full of a strange excitement". Everywhere the peasants were holding meetings to protest against the harsh exactions of their landlords. "I listened to their innumerable tales of sorrow, their crushing and ever-growing burden of rent, illegal exactions, ejectments from land and mud hut, beatings; surrounded on all sides by vultures who preyed on them — zamindar's agents, money-lenders, police; toiling all day to find that what they produced was not theirs and their reward was kicks and curses and a hungry stomach."

This movement had started in the Pratapgarh district of Awadh in late 1919, when some peasants had refused to carry out various tasks for their landlords. The movement had spread to other parts of south-east Awadh, to the districts of Faizabad, Sultanpur and Rae Bareli. In the first instance the organisation had been carried out by village leaders, but later on a sadhu called Baba Ram Chandra had taken over the leadership of the movement. It was he who had led the peasants to Allahabad to see Jawaharlal Nehru in June 1920. After his visit to Pratapgarh, Nehru gave vigorous publicity to the grievances of the peasants in his Allahabad newspaper, *The Independent*. In October 1920, he, Gauri Shankar Misra and Baba Ram Chandra established a central organisation for the peasants, the Awadh Kisan Sabha.

In January 1921 the movement entered a new phase when the peasants began to take direct action against the landlords and money-lenders by looting their property. The nationalist leaders hurried to Awadh to pacify the peasants. Hard on their heels came the police, armed with lathis and rifles, to thrash the peasants and shoot them down. The army was called in to march through Awadh to demonstrate the strength of the Raj. By April, the peasant movement in south-east Awadh had been crushed.

Later in the year, a similar movement against the landlords started in the northern Awadh districts of Hardoi, Bahraich, Barabanki, Sitapur and Lucknow. This, the Eka movement, was also started by village leaders, but this time, after the violence of early 1921, the urban nationalists refused to give any support. Many even condemned the peasant activists as *badmash* and dacoits. In March 1922 there were clashes between police and peasants, and once again the army was called in to intimidate the peasants. With this force behind them, the police and landlord's henchmen moved into the villages to burn the peasants' huts, loot their property and rape their women. By April, the movement in northern Awadh had been crushed also.

Majid Siddiqi has now provided us with the first full length study of the Kisan Sabha and Eka movements of 1919-22. He has brought to light important new information on these movements. For instance, he is able to show that Jawaharlal Nehru was wrong to describe Baba Ram Chandra as the initiator of the Kisan Sabha movement (a view repeated recently by S Gopal in his biography of Nehru, on page 46). Siddiqi shows that the villagers themselves started the agitation against the landlords. During the early stages, the leader in Pratapgarh district was a man of Rur village called Jhinguri Singh. It was he who persuaded Babu Ram Chandra to become the leader of the movement. Before that time Baba Ram Chandra had had very little to do with Pratapgarh district. Likewise, the Eka movement was started and led throughout by a Pasi of Hardoi district called Madari Pasi. Siddiqi has also unearthed a hitherto unpublished and extremely interesting description of the movement by Baba Ram Chandra which, it is to be hoped, will be published in full at some stage.

One of Siddiqi's main arguments is that the peasant movement in Awadh was "... a child of the politics of Indian nationalism" (p x). He says on page 217: "By December 1920, the Congress and the liberals had helped the Kisans to stand on their feet." He argues that the Eka movement was crushed more quickly than the Kisan Sabha movement because the Eka leaders were peasants rather than middle class Congressmen (p 207). He concludes: "The proposition of Marx, that the peasantry must be led from the outside by a class more articulate in its capacity to formulate ideas for the peasantry, was thus once more confirmed" (p x).

Siddiqi's material gives rise to rather different conclusions to this, however. He shows quite clearly that the peasant movements were started and organised by the peasants themselves. In many cases, the nationalist leaders refused to have anything to do with the peasants. When they did take an interest, their chief concern was to water down the radical demands of the peasants and prevent them from taking direct action against their oppressors, the taluqadars. When the peasants started to appropriate the property of the landlords and moneylenders in early 1921, Gandhi hurried to Faizabad and lectured the peasants (p 180): "You should bear a little if the zamindar torments you. We do not want to fight with the zamindars ... Zamindars are also slaves and we do not want to trouble them." During the same period, Jawaharlal Nehru travelled about Awadh telling the peasants that 'Gandhi Baba' was opposed to all forms of violence. When he heard that some peasants had looted a taluqadar to cries of "Mahatma Gandhi ki jai", he hurried to the spot and, in his own words: "...spoke harshly to them for the shame they had brought on themselves and our cause and said that the guilty persons must confess publicly" (J Nehru, "*Autobiography*", p 61) About two dozen peasants raised their hands in confession. They were drag-

ged off by the police and thrown in jail.

Rather than 'helping the kisans to stand on their feet', as Siddiqi makes out, the nationalist leaders appear to have betrayed the peasants. The history of the peasant movement in Awadh appears to refute rather than confirm Marx's proposition, for the peasant movement came into being without the help of upper class leaders and it existed in spite of them.

Siddiqi has a second line of defence for the nationalist leaders. On page 216 he argues that although there *appeared* to be a clash of interests between the peasants and the Congress leaders, *in fact* their interests were the same. The essential struggle, according to Siddiqi, was against colonial rule. The Congress leaders were attacking colonialism in a direct way by trying to throw out the British. The peasants were attacking colonialism in an indirect way, for the taluqadars were only the puppets of the British. In 1921 and 1922 the nationalist leaders had some justification in sacrificing the short-term interests of the peasants to the wider long-term interests of the national struggle.

Here, it seems, Siddiqi has forgotten another proposition of Marx that although the dominant classes invariably *say* that they are fighting for all the people *in fact* they are advancing their own narrow class interests. Whenever it comes to the test, the higher classes will readily sacrifice the interests of the lower classes. In this case, Siddiqi's material provides ample confirmation for Marx's proposition. Siddiqi's case becomes even weaker when we consider the post-independence history of Awadh, for even today, thirty years after the demise of British rule, the landlords of Awadh maintain much of their arbitrary power over the peasants. Thirty years of Congress rule brought very little for the peasants of Awadh.

These attempts to defend the nationalist leaders have diverted Siddiqi from what should have been his real task — to write a history of the continuing struggle of the Awadh peasantry against the taluqadars. Most of the important aspects of this history have been relegated by Siddiqi to his footnotes. Thus the description of pre-twentieth century peasant agitation in Awadh is confined to a footnote taking up half of page 53. The material in this footnote shows that there was a history of landlord-tenant disputes stretching back to at least the mid-nineteenth century. Later, on page 195, another footnote informs us that the Kisan Sabha movement continued in Awadh after 1922, with large peasant rallies during the 1920s and major agitations in 1930-31. This information is vital to the whole story, for it shows that there was a continuing tradition of anti-landlord agitation in Awadh, of which the 1919-22 movement was just a part. If we see the movement in this light, we can understand very clearly why the Congress leaders were so peripheral to the 1919-22 agitations.

Siddiqi fails to make use of his rich material in other important respects. He treats the matter of peasant organisation in a very inadequate manner. In a footnote on page 110, he informs us that Baba Ram Chandra organised the peasants through their caste panchayats. Later, on page 214, we are told that Baba Ram Chandra became a virtual Kurmi himself by marrying a Kurmi woman and organising a Kurmi Kshatriya Sabha. Obviously, caste organisation was central to the whole movement. Yet Siddiqi makes no attempt to draw out the implications of this. He merely equates caste and class in a superficial manner (p 111) and leaves it at that.

Another area in which Siddiqi's footnote material is highly suggestive is that of peasant consciousness. The peasants were yearning for an age of justice under the rule of an enlightened raja. Thus, the movement spread from village to village in mid-1920 with the message that Jhinguri Singh had declared himself Raja of Rur and that he had "swallowed all laws" (footnote on page 116). Later in the movement a popular song was composed which declared: "*Baba Ram Chandra ke rajwa, praja maja urawena*" (in the raj of Baba Ram Chandra, the people will make merry) (footnote on page 112). In this footnote, Siddiqi makes a perceptive observation: "The notion of *raja* and *praja* is so deeply ingrained in the psyche of the Oudh peasant that the idiom used even with regard to a peasant leader is concerning a raj (*rajwa*) and subjects (*praja*)". If Siddiqi had taken this observation further he might have been able to tell us more about the strengths and weaknesses of the movement. On the one hand, the peasants took a very radical stand against unjust landlords. They had powerful ideological beliefs for which they were prepared to fight, suffer, and even die. On the other hand, the peasant's consciousness was limited by the belief that a raja was needed to inaugurate the era of justice. This made them susceptible to outside leaders who were likely to work against their class interests. Therefore, although the peasants took a far stronger stand against feudal landlordism than did most of the Congress leaders. their ideology was suffused with a false consciousness which weakened their struggle.

In this manner, Siddiqi raises more questions than he answers. He has revealed a wealth of interesting material, but has failed to analyse it properly, and has instead resorted to tired and discredited formulas. In many cases, the material directly contradicts his conclusions. If we are to do justice to the peasants of Awadh in their long and valiant struggles against the taluqadars we clearly need a different framework of analysis which places the peasants at the centre of the stage rather than at its periphery.

Feudalism and Kinship in Marwar

Hira Singh

Rajput Polity: A Study of Politics and Administration of Marwar, 1638-1774 by G D Sharma, Manohar, Delhi, 1977; pp 333, Rs 50.

SHARMA's book is a welcome contribution to history and sociology. Credit goes to Sharma for taking up the task of investigating the evolution of political structure of a Rajput princely state during Mughal period, in a way different from that of conventional historians. Sharma's work breaks the artificial and zealously guarded boundary walls between conventional sociology and conventional history. Even though the book has some limitations and the author has chosen to evade some serious issues (which he was in a relatively better position to examine), that does not undermine the overall significance of his approach.

The main theme of the book centres around the nobility (locally known as the *sardars* or the *thikanedars*) of Marwar. It raises some important questions relating to the composition and structure of the nobility of Marwar. Who were these nobles?

What was their origin? What were the relations between nobles and their chiefs? How did the relations between nobles and the chiefs gradually undergo a transformation from co-parceners to feudatories? What were the relations between them and the Mughal Emperors?

It was the beginning of the 13th century. Rao Asthan along with his two brothers, Sonag and Ajay, was camping at Pali, on his way from Kannaj to Gujarat. The territory around Pali was held by the Paliwal Brahmans in their capacity as the *gurus* of the Rajput rulers of Marwar (Udaipur), while in the neighbouring areas the members of the Mer tribe had established their dominance. As the position of the rulers at Mewar weakened, they were not able to provide the necessary protection to their grantee gurus — the Paliwals. It was under these conditions that the Paliwals approached the encamping Rathors, Rao Asthan and his brothers, to protect them against the turbulent Mers in return for a payment of 45¼ *taka* everyday. Rao Asthan not only contained the Mers, but also captured several villages in the neighbourhood, and established his overlordship over the area.

Rao Jodha was fifteenth in the direct line of descent from Rao Asthan. On May 12, 1459, he laid the foundation of a new fort and a new city, named Jodhpur, which remained the capital of the Rathor dynasty until the merger of the state into Rajasthan.

With every succeeding generation following Rao Asthan the Rathors kept on capturing new territories. In this process of territorial expansion the sons and the brothers of the ruler were allowed to hold the territories conquered by them. These holdings were recognised as their *thikanas* (estates). This practice was called *bhai-bant*; that is, being members of the same clan and co-conquerors, their claim over their respective territories was the same that of the ruling chief over his.

It was during the reign of Rao Maldeo (1532-62) that an attempt was made, for the first time, by the ruling chief to transform the *bhai-bant* holders into *bhai-bandh chokars* (servants of the state). In simple terms this was an attempt to impose a tributary system on what was essentially a kinship system of landholding, and to subjugate the kinsmen-sardars to the dominance of the ruling chief. This marks the beginning of the end of the first phase of development of society in Marwar, in which kinship was the basis of union between the ruler and his sardars. This process, however, reached its culmination during 1562-82, when Emperor Akbar established his suzerainty over Marwar. With this the Rathor sardars not only lost their age-old right to choose their leader from among the kinsmen, but were forced to accept the subjugation of an alien authority (the Moghals) who were not even of their clan. Thus was laid the foundation of a new basis of relationship between the ruler and the sardars of Marwar — a relationship of dominance and subjugation. This marks a transition from kinship toward feudalism.

This process of transition was formalised during the reign of Maharaja Sur Singh (1594-1619). He put to an end the traditional system of *bhai-bant*, and issued *pattas* to the *thikanedars*. *Patta* was, above all, a confirmation of the overlordship of the ruling chief over the entire territory of the state, and a *thikanedar* was granted a part of it in retun for service (mainly the military service) and some payment (military cess). Thus, the system of *pattedari* converted the kinsmen-sardars into the servants of the state and of the ruler.

Having shown the origin of the *pattedari* system Sharma goes on to provide very interesting details of the various points of co-operation and contradiction between ruling chiefs and the sardars, between ruling chiefs and the Moghal Emperors and between Maghal Emperors and the sardars.

Sharma does not address himself consciously to any specific issue. His work is mainly in the spirit of fact-finding, and the strength as well as the weakness of the book derives from this. However, the facts adduced throw light on some very crucial and controversial problems in Indian historiography. One such problem is the nature of relationship between ruling chief and his sardars in Marwar. One is immediately reminded, in this context, of the famous controversy between James Tod on one hand and James Lyall and William Crooke on the other. Tod was ridiculed and chided by Lyall and Crooke for drawing an analogy between lord-vassal relationship of medieval Europe and the chief-sardar relationship of 19th century Rajput states. Lyall and Crooke insisted that the essence of chief-sardar relationship in the 19th century Rajputana, Marwar included, was kinship and as such these states were not 'states proper' but tribal clannish settlements.

Sharma's data show that since the days of Rao Maldeo the rulers of Marwar were making attempts to convert their kinsman-sardars into their tributaries. By the time of Sur Singh, with the help of the Moghal Emperor, the *bhai-bant* system (in which kinship was the basis of land-holding by the sardars) had been transformed into *paattedari* system (wherein service to the state and ruler was the basis of land grant to kinsmen). Any serious violation of the *patta* conditions might lead to confiscation, in part or full, of the *thikana* estate.

But Sharma, contrary to his own facts, draws a wrong inference, that it was the general state of confusion in the later part of the 18th century — a corollary of the weakening and virtual collapse of the central authority — which gave Rajput societies a semblance of feudalism. In fact, the author has marshalled enough evidence to the contrary to show that it was during the days of Akbar, the peak of the Moghal period, that the ruling chief of Marwar established his dominace over his sardars. In other words, the hegemony of feudalism over kinship was established in the dawn of the Moghal period, and not towards its dusk, as implied by the author (p 293). In fact, the dusk of the Moghal period marked a decline of feudalism in Marwar when the sardars, taking advantage of the general chaotic conditions created by the disintegration of the Moghal authority on one side and the rise of the Marathas on the other, started asserting their autonomy and independence.

One must appreciate that Sharma's approach is unconventional but he has failed to carry it to its logical conclusion. The main weakness of the work is that it does not include in its framework those on whose labour both the nobles and the chiefs of the state depended. Sharma's main claim is that he seeks to reconstruct the evolution of economic-political structure of society in Marwar; one may rightly ask — is it possible to reconstruct the economic evolution of a society without even mentioning who were the basic producers, and what was the form of production relations? Again, is politics only a matter of what transpires within the ruling class? In this matter Sharma shares with conventional historians the chief limitations of the latter's framework. which begins and ends with the palace, to the exclusion of those on whose labour is founded the entire glory of the palace.

Oral Testimony as Historical Source Material for Traditional and Modern India

Lotika Varadarajan

Unlike the African situation which is based on a degree of fundamental homogeneity, as revealed in the classic work of Jan Van Sina, oral tradition in India betrays considerable heterogeneity.

First is the category of information classified under sruti *which has been handed down from one generation to the next with clearly built-in safeguards to reduce, if not obviate, corruption and distortion in course of transmission.*

Second is that category which can be said to comprise a much looser corpus of material permitting of expansion and incorporation of new material over periods of time. Itihasik *and* pauranic *materials, as also relevant manifestations of folk culture, may be included in this group. For purposes of convenience a further distinction may be made between Hindu sacred knowledge as defined under* sruti *and* smriti *and traditional craft and technical knowledge.*

A third category may be postulated, viz, oral testimony relating to pockets of Indian society transformed by currents generated by modernity while remaining bound to the umbilical cord emanating from the previous cultural mould.

The first portion of this paper relates to the first two categories, while the third aspect is briefly dwelt upon in its concluding part.

ORAL TESTIMONY is one among several sources on the basis of which historical enquiry may be made. Oral testimony relates to that category of historical information which is transmitted from group to group or from one generation to another by means of oral transmission.[1] Oral history, therefore, relates to a technique of information-gathering rather than constituting an independent branch of historical enquiry.[2]

The use of oral testimony for the writing of history is by no means a modern innovation. Hearsay and on-the-spot enquiry have been utilised since the time that history had first begun to be written. In more recent times the method utilised by the British for bringing together the *Mackenzie Collection* of manuscripts, and framing chapters such as those devoted to festivals and shrines in the *Gazetteers* demonstrated the utilisation of this tool. However, until recent times oral sources have not been given the overt recognition accorded to other sources such as literary, epigraphic and monumental evidence. This may perhaps have been because the appropriate methodology by which an inchoate mass of oral information could be transformed into valid historical data had not received adequate attention. Even today, despite the advances which have been made, a great deal more remains to be done particularly in the field of folklore, superstition and myth.

Oral testimony may be elicited in different ways according to the scope of the particular problem. For the writing of political history accurate factual data is of prime importance. Once the authenticity of a particular occurrence on the time scale has been established, the *hows* and *whys* of the event can be scrutinised in greater depth with the use of oral testimony. The Oral History Project being conducted by the Nehru Museum, New Delhi, is utilising oral sources in much this manner.[3] An even richer field in which oral testimony can be used is that of social history. While social history, like other branches of the discipline, is written within the confines of chronology and factual data, human motivation and individual as well as group choice are of greater concern. Totally irrational factors may become valid pointers to historical enquiry if these are of social consequence. The reservations formulated by David P Henige with regard to the scope of oral material is very relevant to the ambit of this paper. D P Henige has stressed the inadequacy of oral information for the framing of chronology in view of the fact that oral information appears particularly rich in societies which have a non-calendrical vision of their past.[4] To the social historian the unravelling of specific distortions may itself prove valuable indices to the nature of bygone social pressures of which there is no mention in the fields of literary and inscriptional evidence.

The feature which is of particular significance in the Indian context is that the oral method was the preferred means of communication in traditional India. By traditional India is meant that segment of the indigenous cultural framework which can be said to have remained peculiarly rooted to patterns of thought and behaviour evolved in undivided India during what may be loosely termed as the Vedic period and which continued into later times. Oral testimony has accrued from many different quarters. In the present essay oral testimony relating to Buddhist, Jain and Islamic cultures have not been taken up for examination. Unlike the African situation which is based on a degree of fundamental homogeneity as revealed in the classic work of Jan Van Sina,[5] oral tradition in India betrays considerable heterogeneity. First is the category of information classified under *sruti* which has been handed down from one generation to the next with clearly built-in safeguards to reduce if not obviate corruption and distortion in course of transmission. Second is that category which can be said to comprise a much looser corpus of material permitting of expansion and incorporation of new material over periods of time. *Itihasik* and *pauranic*[6] materials as also relevant manifestations of folk culture may be

included in this group. For purposes of convenience a further distinction may be made between Hindu sacred knowledge as defined under *sruti* and *smriti*[7] and traditional craft and technical knowledge. A major difference between the two fields is that the vocational aspect inherent to the latter is absent in the former. Moreover, the latter has necessarily to premit greater elasticity as new inventions, techniques and processes have, at each stage, to be incorporated within the existing corpus prior to onward transmission. However, the social context governing transmission of information and avoidance of fallacy is common to both. A third category may be postulated, *viz*, oral testimony relating to pockets of Indian society transformed by currents generated by modernity while remaining bound to the umbilical cord emanating from the previous cultural mould. The first portion of this paper relates to the first two categories, while the third aspect is briefly dwelt upon in its concluding part.

In India the privilege to *learn* or to *know* has always been linked to the "worthiness" of the recipient, and is related to the extent of receptivity shown and the degree of mastery achieved. It has never been accorded the status of an inherent right.[8] Even after scripts had evolved there was always a preference for the transmission of knowledge through oral rather than written means. This was because it was feared that the written word being accessible to a wider public, might fall into wrong hands with the attendant dangers of distortion and vulgarisation.[9] Since the language used was Sanskrit there was also the purely practical aspect that mispronounciation could lead to total distortion in meaning. The fact that the educational system encouraged the emergence of a power elite enjoying a dominant role in the social structure is not really relevant to the theme of this essay.

The educational system was initially developed to serve the needs of sacred knowledge. It performed its task in an admirable manner and served as the prototype subsequently followed in all *gurukkuls*. There was close contact (*antevasin*) between taught and teacher in the ashram school set amidst sylvan surroundings. The development of Vedic knowledge itself passed through several stages prior to being constructed into a definitive mould. The initial stage was that of *mantra darshana* when thoughts were first conceived through visions by sages and rishis. Then came the stages of *samhita* and *brahmana* when this corpus was orally brought together, preserved, systematised and interpreted. By this time the body of knowledge has become very large. The *sutras* were devised to permit quick and easy recall.[10] Each of the four vedas was associated with ten individual compositions which were collectively known as *dasagrantha*.[11] The student who wished to make any headway in the field of learning had to master the entire corpus associated with at least one veda. This gave rise to appellations such as Dwivedi, Trivedi and Chaturvedi which have continued into modern times.

There were clear rules for the learning of the various texts which made up the contents of the early curriculum. The attributes of sound such as pronounciation, stress, rhythm, accent and verbal juxtaposition were exploited to the full to ensure accuracy in transmission.[12] No progress was allowed until the guru was completely satisfied that the set portion had been adequately mastered. There were various devices to facilitate memorisation on the part of the *brahmacharin* and easy recall on the part of the *grihasta*.[13] Permissible levels of variation became institutionalised through the recognition of different *sakhas* or recensions, each having its own school of reciters or *charanas*[14] The necessity for the preservation of Vedic tradition by oral means led to the development of specific branches of learning such as *siksa* (linguistics), *pratisakya* (euphonic modification necessary for turning the word text/*pada* into the hymn/*samhita*), and *anukramanis* (indexes providing the number of hymns, verses, words and even syllables of the sacred text as a means for checking of validity).[15] Since the oral method was the most common means of transmission of knowledge, memorisation constituted a strong concomitant in the educational process.[16] Meaning was, in a sense, secret and hidden until realised through correct pronounciation and memorisation. Understanding could not be achieved without correct enunciation.

The methodology evolved for the transmission of craft and technical knowledge in India has, unfortunately, not received the degree of attention reserved for the transmission of sacred knowledge. The linking of occupation to caste helped to preserve expertise as this evolved through successive generations.[17] Craft and technical knowledge could perhaps be said to have been divided into two streams — the *gurukkul* stream and that of vocational training undertaken against the backdrop of familial relations. There was some intermingling from the beginning as craft and technical knowledge had, to a certain extent, necessarily to be grafted onto Vedic knowledge.[18] The building of the sacrificial altar, the prediction of auspicious moments, the training provided in the *upavedas*,[19] all had a scientific-cum-technological bias. The education imparted to princes included an element of vocational experience.[20] The *Dhanurveda Samhita* of *Vasishta*[21] and the *upanayana* laid down by authors like Charaka and Sasruta prior to the pursuit of a career in medicine[22] are suggestive of the existence of a considerable body of technical and scientific knowledge. If a *vaishya* was to perform his function well he was expected, apart from his knowledge of agriculture, to also possess the rudiments of commercial geography, arithmetic, some linguistic skills as well as practical details of trade.[23] The *grihya sutras* provided the incentive for the development of architectural treatises such as the *vastu shastras*. The *shilpi shastras* and *natya shastras* were concerned with aspects of the plastic and performing arts. During the Gupta period the urbane urbanite or *nagarika* was expected to have some acquaintance of sixty-four *kalas*. This shows that some kind of formalised system for the transmission of craft-learning must have existed from early times. By this period *gurukkuls* had proliferated and the content of the curriculum followed differed from one to another. Technical knowledge was not necessarily transmitted through the same channels as craft knowledge although some degree of inter-connections must have existed. Normally craft and technical knowledge would be vocational. When sufficient advances had been made, thus making formalisation possible, the new corpus of knowledge would be grafted onto the *gurukkul* pattern thus ensuring a degree of inter-meshing between sacred and secular learning.

In occupations requiring a low degree of skill, knowledge was directly passed from father to son or teacher to taught by means of oral instructions and practical demonstration and training. By and large these activities were associated with members of the *sudra* caste.[24] Usually a knowledge of reading and writing was not necessary but in some occupations certain Sanskrit works had to be learnt by heart.[25]

The guild system operated only at the level of protection of economic interests and had no bearing on the nurturing or transmission of technical

and craft expertise. Where a higher degree of skill and finesse were involved in avocations such as sculpture, architecture, painting and the manufacture of art textiles, there was an adherence to some form of apprenticeship operable within the confines of the caste system.[26]

As in the case of transmission of sacred knowledge, in this field also the process was shrouded in secrecy. For this reason, if information in these areas is required today one of the most fruitful paths of investigation is that of oral enquiry. The entire gamut of activities stretching from indigenous methods of navigation to that of weaving and fashioning of prize textiles can best be explored in this manner. However, since the enquirer is, in more cases than not, a rank outsider in the given social milieu, the collection of oral data has to be engaged upon with the utmost tact and self-effacement. At the initial stages the trust of the informant has to be acquired. This enquirer, stepping into virgin territory, is not even sure about the scope of enquiry. At this stage the injection of a tape recorder cannot but arouse suspicion. Nor, in the absence of primary information, can a questionnaire be meaningfully framed. These tools of enquiry can be brought into play at the second stage although both have to be used with considerable discretion.

Another important corpus of oral information available in India is that of *itihasik* and *pauranic* lore.[27] This category has certain distinguishing features. Vedic knowledge was available only to the three upper castes.[28] After about 300 BC the position of women began to decline and they began to be prohibited from participation in Vedic sacrifices.[29] In order to bridge the cultural gap between the educated and the less privileged members of the society, to endow the cultural framework with increased elasticity and to provide a greater sense of unity and identity, *itihasik* and *pauranic* lore came into existence.[30] These compositions were originally recited in simple Sanskrit at public gatherings by professional reciters called *sutas* and *pauranikas*.[31]

There are certain attributes which make *itihasik* and *pauranic* literature of special interest to the historian particularly with regard to the moulding of the Indian psyche and the attitudes of tradition-bound Indian women. Although from the literary point of view the eighteen puranas and two epics have been included within the *sruti* category of sacred literature being accorded the status of the fifth veda, from the functional point of view, these have more in common with the *smriti* category of literature. The *sloka* rather than the *mantra* form found in *itihasa* and *purana* permit far greater variation in meaning, and, in a sense, reflect regional variations arising from differences in cultural patterns.[32]

During the later Vedic period when the student was exposed to *Itihasa* and *Purana*, he had also to master the *Upaveda* linked to the veda of his choice. The Upaveda was the subsidiary discipline which enabled the householder to earn a living. The *Rgveda* was associated with medicine (*Ayurveda*), the *Yajurveda* with military and defence sciences (*Dhanurveda*), the *Samaveda* with dance, drama and allied pursuits (*Gandharvaveda*), and the *Atharvaveda* with agriculture and technical sciences (*Arthasastra*). The practice of trade and commerce was divided between the *Yajurveda* and the *Atharvaveda*.[33] The study of such a system would surely reveal much of interest to the social historian.

Itihasik literature recited by *sutas* may be linked to a later development, that of the maintenance of geneological records found particularly in evidence in Rajasthan and Gujarat. In Rajasthan the maintenance of the *vamsavali* and *pidhiavali* is associated with the *charan* community, while in Gujarat custody of the *vahi* is the privilege of *vahivanca* barots.[34] The *barot* is totally dependent on oral sources for the compilation of data entered in his ledger.[35] It is claimed that veracity is ensured by the presence of the village *panch* during the ceremony of inscription of details of family history.[36]

While Vedic culture with its attendant penumbra of ritual, sacrifice and ceremony, was clearly monopolised by the Brahmins, Pauranic culture opened doors to other modes of religious experience. *Bhakti* and *yoga* were given a new importance while *vrata* and the undertakings of *tirthas* or religious pilgrimages became recognised forms of activity.[37] This generated a considerable body of oral material which is indicative of social mores of the times. Apart from this religio-mythical body of knowledge, oral communication also reflected itself in folklore and associated media such as ballads, proverbs, parables, riddles, superstitions and beliefs arising from observance of totems and taboos. It would be difficult to differentiate between folklore and religious mythology as the former drew heavily from the latter. Other idioms clustered around religious themes and found expression in dance, drama and song. Among these may be mentioned *yakshagana*, *terukuttu* or street play, the *bhagavata mela nataka* relating to the sport of Krishna, *kirtans*, *bhajans*, and *kathas* performed in different parts of the country. Many divergent aims found expression in these forms — edification, entertainment and the fostering of cultural homogeneity. The rural *mela* and *heat* fall into a different category but neither can be excluded from the ambit of oral information.[38]

It is obvious that the extraction of information from this category of oral testimony constitutes a very difficult task. If it can be done, however, it can be an extremely useful source. Oral testimony can rarely be used alone but can prove a very valuable adjunct to more conventional sources such as literary, epigraphic, numismatic and monumental evidence. Jan Van Sina[39] has demonstrated very well how the structural method may be used to distil information from oral sources particularly in the African context. However, scholars have pointed out possible pitfalls in an uncritical adoption of such an approach.[40] David Lewis[41] has explored the world of traditional Polynesian navigation on the basis of oral testimony and practical experience, and the adoption of similar approach may yield much information in the field of Indian craft and technology. The work of Romila Thapar may also be quoted in this context.[42]

The citing of oral sources however has some inherent difficulties. A historian is totally circumscribed by the nature of source material available, and these are usually referred to in the footnotes. Oral information is rarely cited in this manner. Doubtless this is because a historian is chary of citing a source unless its authenticity can be proved beyond doubt. There is also the fear of invasion of privacy if the identity of the oral informant is explicitly revealed. As a result the extent to which oral testimony may have shaped conclusions reached or inferences drawn is rarely made evident. The fact that oral testimony falls more within the domain of social anthropology poses methodological problems for the historian wishing to make use of this tool. The major difficulty arises from the fact that oral information has usually to be processed before it is ready for use, particularly the material which can be gleaned from sacred and mythological narrative. There has to be a proportionately greater investment in

manpower before an adequate distillation of the kernel of historical source material may be secured.[43] However, since traditional India, as defined for the purposes of this essay, remains a living reality, oral material would constitute a very important source for an understanding of the current social milieu.

Upto now the main emphasis has been on the attempted identification of sources of oral testimony as related to traditional India. An initial exploration has been made of the information this corpus may be expected to yield to enable a better understanding of the dynamics of social relationships of the past. The formulation of chronology based on oral evidence, so important to scholars working on Africa, is of secondary significance in the Indian context. An effort is now made to demonstrate the utility of oral testimony in another field by utilising the findings of a study made of a non-Hindu group in contemporary times. This investigation reinforces the view that oral data is of relevance to the study of social relations in any given period of Indian history.

A study was made of the East Indian community which is native to the urban centre of Bombay extending into Greater Bombay. This group was chosen for several reasons. Being converts from Hinduism to Christianity, they would have an anchorage in the social contours of their previous religion while opening themselves to the currents of modernity generated by the adoption of their new faith. Literacy would not be linked to position within the social hierarchy as the opportunities provided by mission schools conducted in English and the vernacular medium would open the doors of learning to all. The existing corpus of printed material on community history[44] can be utilised to pinpoint areas in which oral testimony could be used to secure a richer understanding of community relationships. Oral testimony has shown its utility not so much in the sphere of collection of factual data as in providing a corpus of information on the basis of which inferences may be drawn. The element of subjectivity remains a questionable component but it needs to be emphasised that as in any other category of historical source material, findings are open to reassessment subject to the availability of additional information.

The East Indian community[45] is an extremely heterogeneous group both from the point of view of origin and culture, as well as standard of life and occupations followed. It is a society which has perhaps been subjected to a much greater degree of change than other groups and oral testimony demonstrates this more clearly than references to the printed word. Broadly speaking the East Indian community may be divided into two groups, the urbanised East Indian and the rural East Indian.

Even though it is claimed that Christianity was established in this part of the Konkan as early as the first century AD by the ministrations of the apostle, Saint Bartholomew, this appears to be based entirely on literary evidence. Unlike the Syrian Christian sect in Kerala, there is no extant doctrinal evidence of this early form of Christianity. The group ethos of East Indians is projected backwards in time only to the point when conversions were effected by the Portuguese in the sixteenth century. This fact of chronology has caused the prevalence of a basic dichotomy. Whereas social mores hearken back to a much older caste-ridden heritage, this is allowed expression only at one level. The Portuguese converts had been so well insulated from their erstwhile religious compatriots that the culture which they embraced by virtue of being Christian ran along grooves which were quite separate from the mores and beliefs which formed part of their older heritage.

The superstitious beliefs and lore of the East Indians have a quaint folk flavour but are singularly free of any recognisable Hindu influence. When there is a relapse into brahmanical little tradition as when blood sacrifice is offered, or obeisance is made to Sitala Devi at the time of the affliction of small pox, the East Indian is able to slip freely from one ambiance to another without perceptible signs of guilt. The two worlds are not allowed to impinge on one another. During the wedding ceremony while blood sacrifice may be offered on the way to Church, within the Church there is rigid adherence to orthodox Catholic ritual. Where these practices have shown signs of decline, this has not been so much a result of the strengthening of the Christian faith as because of higher levels of education achieved and increasing inroads of urbanisation.

If the purely social practice of East Indians were to be considered and if the Westernised elite group were to be left aside, these would be found to bear a deep Hindu impress. Certain taboos such as familiarity between father-in-law and daughter-in-law are part of larger all-India phenomenon. Eating habits, social relationships and behavioural patterns bear a strong affinity to those prevalent among Hindus.

In certain areas there is an amalgamation of East and West. This is particularly in evidence in East Indian music.[46] One of the more unfortunate areas is that of addiction to liquor which can be clearly traced to Occidental influence. East Indian cuisine is a happy mixture of Portuguese preferences and indigenous culinary achievements. A somewhat curious feature is that whereas in Goa, beef eating was regarded as virtually synonymous with the state of being Christian,[47] East Indians traditionally *eschewed beef. Samavedi* and *Koli* Christians in the past abstained from pork despite the palate-tickling properties of the East Indian *piece de resistance, sorpotel.*

A notable feature of the community is the total absence of any explicit feelings relating to caste. Whereas in the past endogamous marriage practices tended to prevail, commensality was practised from the beginning. Where endogamy was in evidence it tended to be explained in terms of occupational differences rather than caste origin.

The community as a whole is showing marked evidence of accelerating social change. The attendant stress, however, appears to be taking a greater toll of the Westernised urban elite rather than its rural brethren. Within the city of Bombay, East Indians tend to cluster around certain areas such as Kotachiwadi in Girgaum, in Mazagaon and Bandra. Wherever faceless modern urban architecture has not intruded, these areas have the unique flavour associated with the East Indian *gaothan*, an institution which has to be visually perceived to be fully appreciated. These urbanised East Indians not only share the general ethos relating to the origin of the community but also betray a far greater Western bias in their social mores. The problem of renewal is not an easy one under such circumstances. When, added to this, there is the threat that they the original sons of the soil, are in danger of being edged out of their natural habitat by those endowed with sharper business acumen coming in from other parts of the country, their helplessness cannot but find expression in a deep sense of malaise. The feature of added poignancy is that unlike caste Hindus, East Indians can-

not easily settle in other regions of India without considerable disorientation and feelings of rootlessness.

The rural East Indians, the Vadvals, Samavedis, Kolis and Kumbars to mention a few among them, are in a much happier position as there is no chasm separating them from their non-Christian neighbours. They do not have any identity crisis with which to grapple, nor are they faced with any imminent threat of physical displacement. With improvement in economic status and attainment of higher education a greater cohesion between urban and rural East Indians may well come into being. Already, there is increasing inter-marriage among the different Catholic groups in Bombay and a more homogeneous and viable unit may well emerge.

The study of the East Indian community of Bombay and greater Bombay[47] demonstrates very clearly the differences in approach and methodology required when dealing with material outlined in the earlier portion of the paper as against the corpus emerging from contemporary social life. In view of the availability of primary printed material, questionnaires can be framed. Because of the prevalence of a high standard of literacy and exposure to modern media even among the rural segment, the introduction of the tape recorder would not prove counter-productive. Despite these differences in methodology, the particular contribution of oral testimony to the scope of historical enquiry remains a constant factor. It opens windows into areas of social relations which would either be dormant or remain overlooked if other categories of source material alone were to be taken into consideration.

Notes

[I am very grateful to A N Jani, Director, Gaekwad Oriental Institute, Baroda, R N Mehta, Professor, Department of Archaeology, S G Kantawala, Department of Sanskrit (M S University of Baroda) and P K Dongre, Principal, Sanskrit Mahavidyalaya, Baroda, for their help and the time they so freely made available to me. In citing oral information given by P K Dongre the legend P K D will be used.]

1. This definition may be contrasted with that given by D P Henige. According to Henige oral testimony refers to the corpus of orally transmitted material which specifically recounts the past. The time span is usually limited to three generations, this being the maximum period accorded to personal testimony. Oral poetry, heroic recitations and folk tales have been excluded by him on the ground that these forms are essentially unconcerned with duration and sequence. David P Henige, "The Chronology of Oral Tradition: Quest for a Chimera", Oxford, 1974, p 2.

2 See Paul Thompson, "The Voice of the Past, Oral History", London, 1978, p 54. For the special kinds of insight available from this category of material, see *The Indian History Review*, Vol III, No 2, 1977, E P Thompson "Folklore, Anthropology and Social History", p 251.

3 The team, comprising five members under the Directorship of Haridev Sharma, started functioning towards the close of 1966. Three categories of participants in the freedom movement were chosen for interview — politicians, civil servants and social workers. Interviews are tape recorded. These are corrected, edited, sent back to the interviewee for acceptance, and then transcribed onto paper and filed for future reference by scholars. The original tapes are not necessarily preserved. The whole process is time consuming and in the absence of the required manpower, the pace is necessarily slow.

18 The brahmanical hold on the *silpin* must have, to a certain extent, been organic rather than being based only on the existing pattern of social relationships as is made out by R Lannoy. Please see Richard Lannoy, "The Speaking Tree", Oxford University Press, 1971, p 27.

19 For *upavedas* see below. The curriculum at the University of Taxila is said to have included the study of three vedas and eighteen *shilpas*. The subject matter included in the latter category is, however, unknown. A S Altekar, "Education in Ancient India", Banaras, 1934, p 128.

20 See P V Kane, *op cit*, pp 363-364. C Sivaramamurthy ("The Painter in Ancient India", New Delhi, 1978, p 11) mentions a prince whose education included the principles of examination of gems, woodwork and ivory carving.

21 This was a later work which laid down norms pertaining to *Dhanurveda* or military training. The epics have no references to a specific upanayanam related to this vocation. See A S Altekar, *op cit*, pp 44-45.

22 *Ibid* pp 42-43. For the meaning of the word *upanayana* please see P V Kane, *op cit*, p 269.

23 *Ibid*, pp 364-365; Whereas in the earlier period this training was imparted in the home and the *gurukkul*, during later times special schools called *mahajan* schools came into existence. Here the notation used by *mahajans* in their calculations was imparted to caste members. F F Keay, *op cit*, p 64.

24 *Cf* the mythical origin of *pushan* or the sudra caste in R K Mookerji, *op cit*, pp 157-158, also Milton Singer, ed "Traditional India", Jaipur, 1975 Stella Kramrisch, "Traditions of the Indian Craftsmen", pp 18-24. In Tamil Nadu Vishvakarman Brahmins monopolise such activities tracing their ancestry to the five sons of Vishvakarma, Manu, Maya, Tvastra, Silpi and Visvajna associated with the working of iron, wood, brass, copper and alloys, stone and gold and silver respectively A K Coomaraswamy, "Medieval Sinhalese Art," New York, 1956, p 63.

25 These works contained traditional rules pertaining to a particular craft In south India *Vastu Sastris*, usually members of the goldsmith caste, know rules pertaining to domestic architecture. They are consulted by all those wishing to con-

form to traditional norms. Keay, *op cit*, p 72. In this connection oral information elicited from a master carpenter of the *sutar* community resident at Baroda during a recent interview is of interest. Although couched in allegorical language the broad base of craft knowledge is made evident. According to the informant, Mistri Nanalal Lallubhai Shilpi Shastri (address: Kashta Kala Gruha, Dandia Bazar, Baroda), a master of carpentry would possess a knowledge of the 64 *kalas*. Since the five sons of Visvakarma (see above n 24) were bound by fraternal ties, each could imbibe knowledge from the other, i e, a carpenter would not only be able to work through the agency of wood, but would also be able to handle stone and metal. The disciplines of *jyotisha* and water divining were ancillary to the practice of carpentry. Domestic dwellings had to be so aligned in accordance with *shastric* injunctions as to promote the welfare of its inmates. The task of construction of wells would be rendered smoother if water divining were known. The family of the above named practitioner possesses a manuscript copy of *Rajavallabha* by Mandana. The text, partly in Sanskrit and partly in Gujarati, had been transmitted from generation to generation with the family. Earlier only caste apprentices would be accepted by the *guru*. Chosen students who had shown their aptitude, would be taught Sanskrit to enable them to read the *Shilpa shastras*. Mere book learning was considered very inadequate and had to be enriched and supplemented by oral instruction and practical training received from the *guru*. The master would pass on his innermost craft secrets to his chosen student, and this need not necessarily be his own son. If no one conformed to the desired standard, the master would carry his knowledge with him to the funeral pyre.

6 A K Coomaraswamy, *op cit*, pp 64-68; P V Kane, *op cit*, p 365.

7 *Purana* literally means any old tale or ancient lore. Earlier *puranas* had to follow the literary convention of division into five parts but in later times this became blurred. *Itihasa*, derived from *iti ha asa* (so indeed, it was) denoted, at least in theory, the recording of actual events F E Pargiter, "Ancient Indian Historical Tradition", Delhi, 1962, pp 21-25, 33-39, 41, 54.

28 R K Mookerji, *op cit*, p 267.

29 S G Kantawala, "Cultural History from the Matsyapurana", Baroda, 1964, p 95.

30 For the original constituents of *Itihasa* and *Purana* please see F E Pargiter, *op cit*, pp 33-34, 36-38, 54. The Puranas not only functioned as commentaries on the Vedas but included much other matter. They comprised a growing corpus of information related to subjects such as cosmology, astronomy, astrology, philosophical doctrine, ethics, morality, administrative procedure and justice and common principles of law and equity. For greater palatability moral principles were introduced through anecdotes. It was from the same fountain-head that institutions such as the *kirtan*, *katha* and *bhajan* were to develop later. Employment Planning for Scheduled Castes and Scheduled Tribes

P Hanumantha Rayappa

Deepak Grover

This paper attempts to study the problem of employment and unemployment among the weaker sections of the community, particularly the scheduled castes and scheduled tribes, and the various attempts made by government to improve their living and working conditions.

It begins with a brief socio-economic and demographic profile of the SC and ST population and is followed, in Section II, by an account of their condition in work as well as in unemployment. Section III lists various schemes designed to ameliorate their living and working conditions and also attempts an evaluation of these schemes. This section mainly focuses on employment generation, income augmentation, skill formation and response and non-response aspects. The last section lists the Sixth Plan objectives and strategies for providing employment to the SC and ST and discussed their relevance and feasibility.

I
Socio-Economic and Demographic Profile

THE main distinguishing characteristics of the scheduled castes and the scheduled tribes are their rurality, illiteracy, economic backwardness (lower income, higher incidence of indebtedness, fewer assets, etc) and social retardation (low status, disabilities, etc). The same characteristics are prevalent among the general population also but they are more prominent in the case of scheduled groups. These two groups, the scheduled castes and the scheduled tribes, constitute the 'core' among the weaker sections in India However, it is indeed difficult to identify the weaker sections as they are spread over all areas, occupations and social groups.[1]

The number of persons belonging to scheduled castes was enumerated to be 80 million (about 15 per cent of the total population) and the number belonging to scheduled tribes was 38 million (about 7 per cent) in 1971.[2] Nearly 88 per cent of the scheduled caste population and 97 per cent of scheduled tribe population lived in rural areas in 1971 as against 77 per cent among the scheduled population in the country.[3] Between the two, the scheduled castes are more evenly spread over the country. The scheduled tribes are more secluded and mostly live in inaccessible hill, forest, desert areas or near the sea.

The level of literacy among the scheduled groups has been very low. Almost 90 per cent of these two groups were illiterate in 1961. The literacy levels rose from 10.3 per cent to 14.7 per cent among scheduled castes and from 8.5 to 11.3 per cent among scheduled tribes during 1961-71. During the same censal decade, the levels of literacy among females rose from 3.3 per cent to 6.4 per cent for scheduled castes and from 3.2 per cent to 4.9 per cent among scheduled tribes.[4] Since educational facilities have been opened up only in recent years for weaker sections, the differentials in school enrolment ratios increase with the level of education between the scheduled and non-scheduled populations.[5]

With regard to income levels of these two groups, no data are available either from population censuses or from any other source for the country as a whole. Some idea of their position in income distribution, however, can be obtained from a few census village survey monographs inn 1961. The data tabulated for 30 villages in the state of Karnataka (based on these census village survey monographs) clearly show that the scheduled groups are situated in the lowest income brackets.[6]

Not only is the scheduled population poor and concentrated in the lower income brackets, but it is also deeply in debt An idea of the extent of their indebtedness can be obtained from the National Sample Survey (16th round) and from special surveys conducted in certain tribal pockets.[7] The data provided in these surveys clearly indicate that the extent of indebtedness is more pronounced among scheduled households than among households of the general population. The National Sample Survey data, for example show that 62 per cent of rural households and 47 per cent of urban households among scheduled castes are in debt as against 52 per cent in rural and 34 per cent in urban areas among the non-scheduled households.[8] Their credit needs which are mainly to meet household subsistence expenses are met by the money-lender, trader and landlord resulting in varying degrees of bondage.

Another facet of poverty among weaker sections is the ownership of fewer assets — assets such as agricultural land. Three-fourths of scheduled caste cultivating households cultivate less than 5 acres of agricultural land compared to nearly half among the non-scheduled households. Even though the situation appears to be better in the case of scheduled tribes when compared to scheduled castes, the land actually available for cultivation may be smaller than what is shown in the 1931 Census.[9] The tribal areas of residence being mainly desert, hill or forest, the land available for cultivation would also be inferior in quality

Not only are land holdings smaller in size and inferior in quality, the ownership of other assets too appears to be quite negligible. For example, findings in surveys in Andhra Pradesh, Uttar Pradesh and Gujarat point out that not only did the scheduled groups own less and inferior land but also were poorer in the ownership of other assets such as draft animals, irrigation wells, farm implements, etc.[10] As a result, they are unable to provide any security in order to get benefits such as credit. Thus, they suffer discrimination in the actual availability of facilities. It is also quite likely that the benefits offered to them by agencies such as the government or co-operatives might be misused as they are situated below the subsistence minimum level.

In general, the areas where the tribals live and work are secluded and backward. Also the tribal areas happen to be poorly integrated with the rest

of the economy. The extent of backwardness of these areas can be gauged by the data provided in the Planning Commission document.[11] These data clearly show that in areas where tribals predominate the agricultural productivity per hectare of land is relatively low, irrigation facilities are inadequate and infrastructural facilities such as roads and electricity are poor. In those areas where the scheduled castes are in larger number the area may not be backward, but the access to these facilities for the weaker sections may not be the same as for other non-scheduled groups. They are likely to be discriminated because of their low social and economic standing.

Even though the scheduled castes and the scheduled tribes are concentrated among small cultivators and agricultural labourers, it is naive to equate them with the other weaker sections in rural India. In the first place, in the village caste hierarchy they have been regarded as belonging to very low status. Second, most of the attached workers and bonded labourers are mainly drawn from the scheduled groups. Third, wage rates for similar kinds of work and in similar occupations are likely to be different based on caste considerations. The nature of activities the workers are engaged in are more traditional and less remunerative, particularly among the scheduled tribes. Some more aspects may be enumerated to add to the above list. Among the scheduled groups, castes and tribes differ in their living patterns and, again, there are differences by regions and subgroups among them. For these reasons, the scheduled population of India stands on a different socio-economic footing when compared with other weaker sections on the rural scene.

II

Participation in Work and Unemployment

The data on work force participation provided by the census and other sources clearly point out that the work force participation rates

$$\left(\frac{\text{Total number of workers}}{\text{Total Population}} \times 100\right)$$

are higher among both the scheduled castes and the scheduled tribes than among the general population. In 1961, among males in rural areas, work participation rates were 61.4 for scheduled tribes, 60.1 for scheduled castes and 57.5 for the non-scheduled population. In the case of females in rural areas, the differences were greater. The female participation rates were 52.5 for scheduled tribes, 35.9 for scheduled castes, and 28.2 for the non-scheduled population.[12] As between the two scheduled groups, scheduled tribes have much higher participation rates than scheduled castes. A similar picture emerges from the 1971 census. This phenomenon can be observed not only at the national level but also at the state and local levels as well.

Data on activity status (with a day as reference period in contrast to usual activity in the census count) provided by the National Sample Survey (25th round) for weaker sections (non-cultivating households and wage earner households) also bring home the point that the annual labour force participation days per person are high in the case of weaker sections. As has been pointed by Sinha these sections work over 300 days in a year in the case of males and over 275 days in a year in the case of females.[13] Since the scheduled caste population forms the core among the weaker sections in the rural setting, labour force participation among the scheduled groups should be on the higher side. The work participation rates being higher among the scheduled groups it is expected that children and women and the more elderly are drawn into work force as they are forced to work to eke out a living.

The concentration of workers belonging to scheduled population in agriculture has been highlighted by the data provided by the census and other sources. In the case of scheduled tribes 86.6 per cent of total male workers and 89.4 per cent of total female workers were engaged in agriculture in 1961. In the case of scheduled castes 69.3 per cent of male workers and 77.4 per cent of female workers were in agriculture. This is in comparison to 62.0 per cent of male workers and 78.3 per cent of female workers among the non-scheduled population.[14] This concentration of scheduled workers in agricultural sector continues in 1971. The percentage of work force in agriculture (as cultivators and agricultural workers) bears a direct relation with work force participation. Among the other industrial categories, the scheduled workers are concentrated in other services, mining, quarrying, and household industry. Scavenging, tanning, curing of hides have been dominated by workers belonging to scheduled castes only. The occupational distribution of scheduled population when analysed by broad occupational categories will fail to give proper insight into the nature of activities they perform. Some of the traditional activities they perform are uncommon among the general population. They are traditional, more time consuming, less productive and remunerative in nature and explain the poor conditions in which they live and work.

The situation of these workers in urban areas does not appear to be better either. In urban areas, the concentration of scheduled workers is in primary or tertiary sectors which account for more than 50 per cent of the scheduled work force. It also needs to be noted that about one third of scheduled caste female workers are engaged in scavenging. One reason for their continuing in traditional low occupations such as scavenging, sweeping, etc, is the existence of a steady demand for their work. These low status activities have not been encroached upon by workers belonging to other caste groups. Therefore scheduled groups find it easy to obtain employment in such activities.

The number of persons belonging to scheduled castes and scheduled tribes who are employed in public sector undertakings is rather small compared to their share in the population. Only 3 per cent of total class I employees belonged to scheduled groups. Similarly their share in class II positions was only 5 per cent of the total in 1971. The employees belonging to scheduled castes are mostly in class III and class IV positions.[15] The lower representation of these workers in class I and class II positions is attributed mainly to their low educational attainment.

In the 1961 census an attempt was made to classify the persons reported as non-working into the unemployed category. The unemployed comprised persons in two categories of non workers: (a) persons previously employed and seeking work; and, (b) persons seeking work for the first time. No such estimates of the unemployed are possible in 1971 on the basis of the census classification of the non-working population. The unemployment figures obtained from the 1961 census show that the unemployment rates

$$\left(\frac{\text{Total unemployed}}{\text{Total Labour Force}} \times 100\right)$$

are higher among the general population than among the scheduled groups.

Among the scheduled tribes they are almost negligible. For example, the unemployment rate among the general population was 0.74, among the scheduled castes it was 0.51 and among the tribes it was 0.16.[16] However, it needs to be pointed out that the unemployment rates based on 1961 census are underestimated particularly in the rural areas and more so among females.[17]

The National Sample Survey in its 26th round (1970-71) obtained data on unemployment among weaker sections (households of marginal farmers and landless labourers) in the rural areas for states in India. Unlike census data these unemployment figures have a short reference period. Two striking things emerge from these figures. First, the unemployment rates in the rural areas are much higher in the National Sample Survey sample compared to the 1961 census figures. Second, female unemployment rates exceed the male unemployment rates. According to the National Sample Survey male unemployment rate was 6.4 and female rate was 10.1.[18] Therefore, the unemployment rates among the scheduled population may not be very high but definitely are not as low as what the census data indicate.

One other way of looking at unemployment among the scheduled groups is to look at regional data on unemployment provided in the Sixth Plan document The data are given for different regions within a state and provide some insight into the problem. Within a state, regions where scheduled tribe population predominate, unemployment rates are relatively lower except in one or two cases. On the other hand, no such pattern emerges in the case of scheduled castes. Since scheduled castes live with the general population they are more likely to be closer to the general population and regional data as such are not expected to indicate any pattern for the scheduled castes.

One possible explanation for this phenomenon of lower unemployment among weaker sections is that at higher levels of living, people can afford to be discriminatory in their selection of employment while lower income families cannot. Also, among the lower strata nature of job is not a consideration whereas in upper social groups certain occupations are a taboo. There are certain characteristics of the scheduled groups such as rurality, illiteracy and economic backwardness which point towards lower unemployment rates. Of course, the extent of unemployment reported depends on the concept of unemployment used. The available evidence on weaker sections tend to indicate lower unemployment levels on two counts (time criterion and willingness criterion) and relatively higher levels of unemployment on two others (income criterion and productivity criterion).[19] And, lower rates of unemployment might get compensated by higher incidence of underemployment.

III

Employment Schemes

During the last three decades several schemes have been initiated for the upliftment of the weaker sections.[20] Of course, these are not meant exclusively for the scheduled castes and tribes. These schemes aim to provide additional and seasonal employment and also supplement their income. Schemes such as *minor irrigation*, land reclamation and soil conservation are meant to provide new and seasonal employment. Schemes such as dairying, poultry and piggery are to provide additional employment and income. Public works programmes such as rural road construction, bunding etc, are offered as a source of employment during slack seasons.

Some of these schemes are supposed to ensure continuity of employment and income. Some other schemes are target-group oriented. Small and marginal farmers, landless agricultural labourers, artisans, persons engaged in household occupations, scheduled castes and scheduled tribes are the targeted populations. MFAL, SFDA, DPAP and CSRE are some of the schemes that are directed specially to the above mentioned groups. To use optimally existing skills and to provide job opportunities at different levels of skill is one of the major objectives of these schemes. Provision of new openings for the skilled, semi-skilled and unskilled persons is sought through these schemes. In Maharashtra under EGS a statutory guarantee is given for providing jobs to the rural unemployed.[21]

Thus, while most of these schemes envisage the provision of new and additional employment or employment during slack seasons there is no attempt made to really understand the problem of employment and unemployment among the weaker sections. Our analysis of data from census and other sources in the earlier sections reveals that work participation rates among weaker sections were considerably higher for scheduled castes and scheduled tribes and also that unemployment rates were much lower when time criterion was adopted. This fact also was highlighted by several micro village level studies. Sinha has argued that "Labour Force Participation Rates" as well as the annual "labour force days per person" are as high as is humanly possible among the weaker sections.[22] Provision of employment may be relevant to some selected groups among weaker sections such as women, children and the aged. New employment may be relevant for some others. Efforts made to wean them away from their traditional occupations into more productive and remunerative activities might not have met with success either.[23] But more important than providing additional employment is giving them better remuneration for their work and labour.

The available evidence on the earnings of these weaker sections uniformly points out that these workers are paid very low remuneration. Under the CSRE programme wages were fixed at Rs 3 per day.[24] Under EGS in Maharashtra in 1971, the average wage per day of an agricultural labourer was Rs 1.84 and that of a small cultivator was Rs 1.79. The revised wages in 1974 under the same scheme ranged from Rs 3.00 to Rs 4.50. On the basis of data from National Sample Survey Raj Krishna estimates Rs 1.38 to Rs 2.30 per day as the average actual wage.[25] The legislated annual minimum wage rates are in the vicinity of Rs 200 to Rs 1,800 excluding food, clothing and other necessities.[26] From these it becomes clear whether the living conditions of weaker sections can be better than what they are under prevailing conditions. Also the remuneration from their traditional activities has been very low.

There has been some controversy with regard to minimum wage rates that should be offered to rural labour in India. One view has been to offer lower than normal wages on the ground that this would not disturb the pattern of existing employment. If continuous rather than slack season employment is to be provided it would require wages at a level higher than those prevailing. Also this would enable to withdraw some labour from agriculture resulting

in more employment for those remaining behind.[27] Recently Sinha has presented a case for higher wage rate than what is prevailing. According to him prevailing rates will not only widen the existing disparities but also sizeable proportions of population will continue to live below the poverty line.[28] The existing systems such as bonded labour, 'jita system', also lead to exploitation of labour on the rural scene. And whatever the wage rate offered under public work programmes it does not guarantee any improvement in their consumption patterns which also happen to be on the lower side.

Not only is the level of income of weaker sections low but also low is their share in its distribution. According to one estimate the lowest 20 per cent of households accounted for 9.5 per cent of total consumption expenditure in rural areas.[29] The inequalities in income may be still greater. The ownership of assets by households of weaker sections in the rural areas is not good either. The poorest 10 per cent of rural households owned only 0.1 per cent and the richest 10 per cent owned more than half of total assets (mainly agricultural land) in 1971-72 as well as in 1961-62.[30] The plan document points out that up to the 1960s the land reform measures had no visible impact on the distribution of rural property. As on July 31, 1977, the estimated surplus area was only 5.32 million acres, the area "declared surplus" was 4.04 million acres, the area "taken over" by governments was 2.10 million acres, and the area actually distributed was only 1.29 million acres.[31] The efforts made in recent years in the direction of distributing surplus agricultural land may have had only a marginal impact. As a result of low income and lack of asset ownership, the majority of the scheduled population have had to depend on landlords, money-lenders, traders and other non-institutional sources for their credit needs. This in turn increases their 'bondage' with their credit suppliers. A substantial proportion of their borrowings are used for meeting consumption needs rather than for other productive uses.

The work programmes designed for the weaker sections in the rural areas do not take care of the skills of the weaker sections. It has been emphasised earlier that the literacy levels among weaker sections are the lowest, particularly so in the case of females. Therefore it should have been the prerogative of these schemes to induct some skill formation element built into the nature of these schemes. However, from a glance at the nature of these schemes it becomes clear that upgrading of skills or training among workers has not been given the due consideration it deserves.

Even though a certain percentage of jobs in the public sector undertakings were reserved for candidates belonging to scheduled castes and scheduled tribes many existing vacancies could not be filled due to non-availability of suitable candidates belonging to scheduled castes and scheduled tribes. The data show that many reserved vacancies had to be concelled on account of non-availability of eligible candidates.[32] This points out the need for providing special training facilities and relaxation of existing standards in order to accommodate the available candidates among the scheduled population.

One of the important measures taken to wean children and youngsters belonging to scheduled groups into schools and colleges is to provide scholarships and stipends both at the pre-matric and post-matric levels. An idea of the extent of help offered to these groups can be gauged from the growth of these scholarships over time. In recent years, the number of post-matric scholarships offered has more than doubled compared to 1950s and early 1960s.[33] As a result of these measures the number of students belonging to scheduled groups has multiplied in colleges and universities in the country.

However, there has been an uneven distribution of post-matric scholarships awarded to scheduled population across different states in the country. Among scheduled castes, states such as Maharashtra, Uttar Pradesh and West Bengal with a share of about 40 per cent of total scheduled population in the country have garnered about 60 per cent of total awards made. Similarly, in the case of tribes, only two states — Assam and Bihar — have taken a big chunk of about 70 per cent of total awards for their less than 20 per cent share in the scheduled tribe population.[34]

Not only is the distribution of awards uneven across states but also by individual castes and tribes within each state. For example, in Gujarat, Mahyavanshi caste have garnered a big chunk (about 68 per cent of the total awards in the state) out of total scholarships. Similar is the case in Maharashtra and Tamil Nadu (Mahars and Adi Dravida, respectively). Among tribal groups also, the distribution of scholastic awards has been uneven.[35]

It has been pointed out in several studies that the workers belonging to weaker sections are not willing to move out of their occupations and villages. There are many taboos among certain groups which restrict their social mobility. However, this may not be universal. This is the case particularly among workers who are only partially attached to the labour market — women, children and the elderly. This point was highlighted from the National Sample Survey data from the 25th round.[36] Visaria also found that more than half of male and two-thirds of female farmers were unwilling to take up work outside their farms.[37] Therefore before designing schemes to benefit the weaker sections there is need to locate the areas where pockets of surplus labour exist and are available for employment.

Many times the expected response from weaker sections may not be forthcoming. This non-response can take several forms. It has been reported that those who register as available-for-work may not report for work as and when required or the total turnout may be considerably less than expected.[38] Women appear to be more responsive to such work than men. The response also depends on the amount of rainfall and the expected crop yield during a particular agricultural year.[39] Also there is some evidence to show that drop-out may take place if the working conditions are not satisfactory or the nature of work is more strenuous.[40] This aspect has not been taken into consideration while locating or designing schemes.

Finally there are a few drawbacks and limitations of these rural employment schemes that are not conducive for the betterment of the lot of the poor. In the first place, most of the rural work programmes are of an *ad hoc* nature. They neither ensure continuity of employment nor income required for a minimum standard of living and working. They do not provide security of employment for those who have come forward to work on them.[41] Tarlok Singh refers to these schemes as relief measures rather than permanent solutions to either employment or poverty.[42] This factor may deter the weaker sections from discontinuing their traditional

activities however low the remuneration may be or to leave their traditional employers.

Second, even though these schemes are meant to benefit the weaker sections they may in actuality serve the rural better-off. This point has been highlighted in several studies. For instance, Dantwala cites two irrigation schemes where the actual beneficiaries happened to be big farmers. According to him a more equitable distribution of benefits would have considerably enhanced the employment potential of these schemes. This in turn requires major institutional changes in the rural agrarian structure.[43]

IV

The Sixth Plan

The draft report of the Sixth Plan (Draft Five Year Plan, 1978-83) lists the following three objectives to be achieved within a period of ten years;[44]

(i) the removal of unemployment and significant underemployment;

(ii) an appreciable rise in the living standards of the poorest sections of the population; and

(iii) provision by the state of some of the basic needs of the people in these income groups; needs like clean potable drinking water, adult literacy, elementary education, health care, roads, housing, nutrition, electrification and environmental improvement and some minimum services for urban slums as well as in rural areas.

In order to achieve the above named objectives the plan document presents a number of redistributive measures These are:

(a) *Distribution of assets*· The poor access of scheduled sections to assets like credit, irrigation, electricity etc, is to be overcome by a block level target group approach. Selecting blocks with higher proportion of scheduled population as a development priority is proposed. Within a block, adequate representation of scheduled persons on plan implementing bodies is expected to ensure access to these assets. The distribution of agricultural land is expected to increase both employment and social status. Adequate credit facilities that would be made available to the scheduled population are meant to help them own land.

(b) *Distribution of essential goods and services:* The scheduled population would be able to procure essential consumer goods, farm inputs and implements with the help of credit from commercial, lending, banking and co-operative agencies. These agencies would replace the traditional money-lenders. Transport, health and other essential services would be made available on a priority basis in areas where scheduled population predominates.

(c) *Provision of employment through public works programme:* The Sixth Plan envisages the provision of employment through public works programmes. It also proposes imparting skills to the scheduled population to improve their employability. In the Sixth Plan employment generation is built into the two basic development strategies, *viz*, Integrated Rural Development (IRD) and Minimum Needs Programme (MNP). The implementation of these two along with regulation of technology is expected to generate new as well as supplementary employment. While IRD takes care of developmental activity (agriculture, land use, water management, forestry, social infrastructure, village and cottage industries, dairying, agro and forest industries, etc) MNP makes available minimum needs.

The low employability of scheduled population stems from their poor skill and educational endowment. IRD, MNP and Backward Classes Plan provide for improvements in skill levels of these sections. IRD schemes for skill formation include training in agro and forest industries, dairying, repair and maintenance of agricultural tools and implements, etc. MNP takes care of elementary as well as adult education. Backward Classes Plan makes a more concentrated effort and provides for scholarships, stipends, freeships, mid-day meals, uniforms, book grants and hostel facilities. To increase the competitiveness of scheduled sections in various all-India and state services several pre-exam training and coaching centres have already been set up (seven coaching centres for all-India services, thirteen centres for state services and two centres for all-India Engineering Service Exams) while more new ones are proposed to be set up. Almost half of the backward classes plan allocation is to enhance the employability of the scheduled groups.

(d) *Development of scheduled population areas* A decentralised block level approach is a major sixth plan strategy for full employment, development, raising productivity and meeting minimum needs. Beginning with 2,000 blocks the entire 5,100 blocks of the country would be gradually covered to achieve plan goals by the end of seventh plan (1988). The priorities determining block selection include proportion of scheduled population as an important criterion. Thus, all blocks in tribal areas, contiguous non-tribal areas with more than 50 per cent tribal population and blocks with 20 per cent or more scheduled caste population would be selected on priority basis.

The tribals are also the beneficiaries under the backward areas plan. The tribal sub-plans are meant exclusively for them and are expected to cover two-thirds of the scheduled tribe population. The backward areas gain in the form of concessional investment and finance, finance, subsidised transport and special allocations for developing infrastructure. The sixth plan would encourage selective investment under area, regional and backward classes plan. Such investment will have an enlarged spread effect, will not push tribals further deep into the hinterland as happened earlier in case of non-selective investment and make them co-sharers in emerging benefits. This approach is expected to wean the scheduled sections away from their traditional occupations, attitudes and primitive agricultural and economic practices.

(e) *Organisation of the poor in order to plug the leakages in the redistribution programme* Organisation is expected to improve the bargaining power of scheduled and weaker sections and attain for them their due share in the benefits that accrue from planned development. Adequate representation on plan implementing bodies, improved and effective administration are also expected to be helpful in this context. Not only these measures are expected to plug the leaks but also obtain for them distributive and redistributive justice.

(f) *Consumption credit and debt relief*. Among the scheduled households a major need for credit is to meet their essential consumption needs. The need is more during lean months of the year and during the period of lean harvests. Without assets of any kind they turn to the available sources of credit — money-lender, landlord or trader — and enter into varying degrees of bondage. Once in debt they are always in debt. Debt relief and consumption credit available from co-operatives, banking institutions, etc, would help them to come out of the vicious cycle of debt and bondage.

The proposed financial outlays for

the welfare of the scheduled groups show a substantial upward revision. For example, as against Rs 327 crores budgeted in the Fifth Five Year Plan (1974-79), Rs 545 crores are to be spent in the Sixth Plan period (1978-83) for backward classes and Harijan welfare. (Almost half of this is for schemes to improve employability, about 30 per cent for economic schemes and rest for health, housing, drinking water, etc.) Similarly as against Rs 450 crores allotted in the Fifth Plan period for Hill and Tribal area development Rs 800 crores have been allotted for this purpose in the Sixth Plan.

From our analysis in earlier sections it became evident that persons belonging to weaker sections in general and scheduled castes and scheduled tribes in particular do not require additional employment except in the case of marginal workers. They are already overworking measured in units of time. Provision of seasonal employment may be relevant in certain cases. But, provision of new employment (non-traditional, more productive) or changing the status (monetary as well as social) of their present employment may be more relevant aspects of the problem. Also, majority of these new opportunities should be confined to agriculture, agro based industries, cottage industries or forestry.

From an overview of the strategies and measures proposed during the Sixth Plan period these issues do not clearly emerge. In the first place, in order to improve the working conditions of the scheduled population, it may be necessary to modernise the traditional occupations in order to make them more productive and remunerative. This implies adoption of micro planning rather than macro approach. Each tribe or caste may become the unit for the purpose of micro planning. Also, it is not very clear how provision of seasonal or additional employment will be differently impemented from what was being done during the last several years. The proposed schemes will continue to be of an *ad hoc* nature and would not ensure continuity of employment. The plan document does not, however, recognise this aspect. Of course, the document does state that the funds provided under the backward classes sector will be utilised mainly to diversify their occupations, train them for various trades and crafts and modernise their skills to make them more competitive.[45]

The problem of providing and improvising existing skills for these people will have to be considered from several angles. By providing scholarships, stipends and special training programmes the educational attainments of the youngsters can be improved who can later compete for white collar jobs in the market. This will lead to more jobs being filled by candidates claiming scheduled status. However, the major problem is with respect to those who are not in schools and colleges and who are working. It may not be practicable to call the workers for training exclusively. They have to be trained on the job and thus upgrade their skills. Therefore there is greater need to implant skill developing built into the nature of public work programmes. We are not sure whether this aspect has been given its due consideration in planning and implementing public works programmes.

The plan document is optimistic that measures such as land distribution and provision of institutional credit will improve the asset position of the weaker sections and will be able to provide better access to assets. It needs to be seen whether this will have more than marginal impact. On access to assets, in particular land, the plan approach is not pragmatic. There is just not enough land to go around. Then there is the problem of misuse of credit and other input facilities meant for weaker sections by others as well as by the weaker sections themselves. This is quite expected when majority of the scheduled population is entrenched below poverty line.

The idea of developing backward and tribal areas is good but whether the benefits will accrue to all the needy is doubtful. Provision of infrastructural facilities like roads, electricity, irrigation would definitely help to develop the backward areas there net impact on the weakest among the poor is to be seen. Also response from the weaker sections to the proposed schemes and strategies is yet to be studied and analysed. Some earlier schemes had pushed tribals deeper into the hinter-land, thus depriving them of not only plan benefits but also their existing means of livelihood.

Income position of the scheduled and weaker sections is porposed to be improved by encouraging them to take up activities such as dairying, piggery, forestry and horticulture. It is well recognised that these activities will require both time and inputs which are scarce commodities for the scheduled groups. Among the families who mostly earn their livelihood as agricultural labourers, there may be no time left with them to care for cattle, poultry or plants. Similarly such families might not possess the required inputs such as fodder, seeds, fertilisers and insecticides.

The plan document visualises improvements in productivity as a result of measures outlined earlier. These productivity measures are in turn expected to improve the living conditions. However, what is not clear is whether productivity increases will be matched by corresponding increases in wages. Also the document is not definitive on the question of fixing minimum wage laws and their effective implementation in the rural areas. Unless wage increases are effected the adverse impact on consumption levels and productivity are bound to be felt As has been pointed by Sinha programmes which provide additional work but at a wage rate which is inadequate even for the minimum living will be self-defeating in their purpose.[46]

Organising poorer sections to avoid misused of benefits intended for them as well as discrimination in job opportunities and remuneration is a welcome proposition. However, in the present environment the problems in this area are formidable. The organisational leadership should come from the persons among these weaker sections who can effectively tackle the problems. If it is not forthcoming, outsiders can easily manipulate and mislead them. The administrative machinery may not be capable enough to tackle all the problems even if an organisation comes into being. Mere legal protection may not be enough to save them from exploitation and harassment.

On the basis of our analysis, a few concluding observations can be made. In the first place, there is a need for careful analysis of data on weaker sections (particularly on scheduled castes and scheduled tribes) even though such data are scarce and are partially helpful for the purposes or planning. Greater caution is required in drawing policy inferences on employment and unmployment aspects based on these sparse data. More detailed inquiries are necessary for different caste and tribe groups at the national, state and local levels.[47] Second, the attempts made so far to ameliorate their living and work-

ing conditions are of an ad hoc nature and have not tackled the problem in its entirety. Better co-ordinated and more concentrated efforts are needed to successfully tackle their problems. Finally, the measures that are likely to be initiated in the future should be pre-tested for their relevance and feasibility. At the same time, careful monitoring of the results and their evaluation are required. All these aspects should form an integral part of the integrated development programme.

Institutionalised Inequality in Kolar Gold Fields

G N Rama

THE report on the Kolar Gold Mines by George Mathew (*EPW*, April 7, 1979) dramatises the pathetic plight of not only 12,000 miners but their helpless dependents. Perhaps a brief discussion of the historical conditions leading to the present dismal state would place Mathew's description in perspective.

Until the 1970s Kolar Gold Field (KGF), especially the mining community, functioned as an insulated society impervious to any external influence. The social cleavages are much too rigid and have been ther over half a century. Until recently, if a person were a caste Hindu, aged 40 or over, the chances were that he lived in a spacious bungalow with a couple of servants, owned a scooter or car, played golf, was a member of exclusive clubs, had two children who would be educated outside KGF, owned a house in a prestigious locality in Bangalore, and accumulated some savings. On the other hand, if one were an Adi-Dravida Hindu or Christian (ADH or ADC) the chances were that he lived in a thatched or concrete hut located in a slum-like area, had about four or five children and a wife who worked as a cleaning woman, found it hard to provide two square meals, and was deeply indebted to Marwaries.

What is the source of such an ongoing disparity? Why are the bureaucrats, trade union leaders, and politicians insensitive to the depressing standard of living of gold miners? These are questions that Mathew fails to address himself to in his report.

Evolution of KGF Labour Force

Crucial to our understanding of the present outrageous differences in income and living conditions among the gold mine employees is the delineation of how the labour force was recruited, and the ranks assigned by the founder-owners of the industry — John Taylor and Sons of England. The main object of the British firm was to speedily exploit the yellow metal and ship it to England. Towards this end, they heavily invested in machinery and imported technical staff, but not in their blue-collar work force.

Some of the documents in the custody of the present bureaucrats (Central Administration Department) suggest that in the first 30 years, four different groups of employees were recruited. The managerial and technical personnel were 'imported' from England, junior technical and clerical staff were recruited from Kerala, the erstwhile Madras, and Mysore states, and underground coolies mainly from North Arcot district of Madras. Therefore, the entire labour force was immigrant in character with varying racial, linguistic, religious, caste, and class backgrounds. It was precisely such selective recruitment that resulted in the segregated housing, differential incomes, and status crystallisation in the years ahead. Therefore, the disparity between workers and officers was more due to careful design than to accident. For example, the mining colony was developed by the British owners taking into account racial and caste backgrounds of their employees. Fully fenced and landscaped bungalows with servants' quarters, and exclusive clubs were provided for their managerial and technical staff. But the caste Hindu white-collar employees were not given such preferential treatment, though they were provided with relatively adequate housing and other facilities.[1]

The underground miners (coolies) received the most cursory and inhuman treatment. In terms of origin, as Mathew points out, most of these coolies were from North Arcot district and belonged to Harijan castes. They migrated to KGF in a bid to get away from bonded labour.[2] Besides, an industrial setting seemed to offer certain prospects which the impoverished North Arcot villages did not. The documents show that the first generation of coolies were young and single. They came with a hope of earning enough money to enable their relatives to get out of bondage. Once in KGF, they found themselves in a situation not significantly different from the one they left behind in their villages. Their wages were low, and there was no job security, retirement benefits, medicare and so on. Further, most degradingly, the British owners housed them in single-roomed thatched huts which were segregated from the rest of the gold mining community.

It is not difficult to understand the basis of such blatant discrimination, which continues even today. Consistent with colonial thinking, the British owners never expected the coolies to be permanent employees living with their families. The colony of huts were referred to as "Camps" for Coolies. The assumption was that these coolies would return to their native villages after a few years and not establish families or households. Hence, those conditions which facilitate long tenure and commitment on the part of the worker to the mines were scrupulously denied. For example, a worker who was injured in an underground accident was simply given his wages plus return train fare to his village and retrenched from service. This was done despite the fact that there was a hospital which catered primarily to the officers' health needs. This situation prevailed until the trade unions became active especially after Independence in 1947.

In the meanwhile, the workers who migrated to these camps in search of a better deal continued to live in the huts with their large families — huts which were not fit to house even the pets of

the white masters. This was fertile ground for conversion of workers into Christianity, and the few Church organisations engaged in relief work had a lot of work to do. But as has been shown elsewhere, change of religion did not substantially improve the fortunes of the Harijan coolies.[3]

In short, the labour force of the gold mines, though highly stratified often on ascriptive criteria, was more often organised according to the whims and fancies of the British management. Obviously then, the KGF labour force was organised not just in terms of occupational ranks and skills but in terms of race and caste as well.

Restricted Opportunities for Mobility

The most important qualification for occupational mobility during the John Taylor regime appeared to be proximity; that is, those that had access to their British masters had greater chances of mobility than the ones who did not. For example, the ADH miners were too far below in the occupational gradation and seldom had opportunities to impress upon their masters their skills and competence. Lacking in clearly set rules, the bureaucracy was incapable of providing impersonal and rational channels for promotions. Very little was done to alter this situation even after nationalisation of the mines.[4] On the one hand, it was almost impossible for miners to move up through ranks, while on the other, they were ineligible for top positions since these required formal qualifications. However, the miners had little access to education. Obviously, the British management was hardly keen on providing such access as this could have resulted in short supply of cheap labour.

But the situation was different for the officials and white collar workers. The management supported the KGF School and Saint Joseph's Convent situated close to the exclusive residential area of officers and these schools admitted only children of white-collar staff, a practice which continued until 1956 or so. Besides, an educational allowance was given to those children who wanted to go to colleges outside KGF.

Furthermore, an examination of the payrolls of the officers (no such payrolls were available for miners until the middle of 1940s) reveal that there were frequent promotions, especially among the caste Hindu officials, in the 1940s and 1950s. For example, many agents, assistant metallurgists, auditors, assistant engineers and so on, were caste Hindus throughout this period. The criteria for such promotions were not stipulated. It appeared that loyalty, proximity, subservience, and an ability to appear hard-working were important for occupational mobility among officers. In any event, at the time of nationalisation almost all top positions were held by Britishers, with caste Hindus next in order.

In essence, if one examines the labour force, the salary structure, housing and other perks of the Kolar Gold Mines in the first fifty years of their history, one cannot fail to see the evolution of a hierarchic structure based not on any rational premises but on favouritism, discrimination, and exploitation. To make matters worse such a hierarchic structure was not only institutionalised but also insulated from any public scrutiny as the Gold Mines operated as an independent colony free of any internal criticism and protest, and external interference. This, to a large extent, explains the failure of trade unions and political leadership in exercising any influence on the management of the mines in the early period.

After Nationalisation

The demand for nationalisation of the mines in the 1950s must have come as a welcome development to the British owners for they knew that the mines could no longer be a productive and profitable enterprise. The machinery was antiquated, the mines were too deep with few new reefs in sight, the trade union movement had gained momentum making demands which the Britishers were not used to, and finally the British employees themselves were eager to return home as the socio-political milieu generated by the successful freedom movement was not conducive to their continuation. Consequently, the ownership of mines was transferred to the then Government of Mysore but many technical personnel stayed back with a view to train their Indian deputies who were willing and eager to step into the shoes of their masters.

By 1962 all but three Britishers had left KGF leaving behind their coveted positions and a colonial culture to their loyal caste Hindu subordinates. Once elevated to the positions of power, prestige and perks, the neo-colonial Indians wasted no time in emulating their departed bosses in terms of life style, accumulation of personal wealth, segregated living, exclusive recreational habits, and such other affluent preoccupations. But few appeared to have demonstrated awareness of their social and moral responsibilities. Their attitude and approach to work were essentially colonial. Here were a coterie of roughly twenty five top officials presiding over an unprofitable industry but totally oblivious to changing political and social conditions of a young nation. The future of the gold mining community rested in their hands but, as Mathew points out, they let it decay beyond rescue.

Was the gold mine bureaucracy any more open after nationalisation? Perhaps, but only in a formal sense. The recruitment was much more systematic and one could see token representations of ADHs among officers. But as I have documented elsewhere[5] family and caste backgrounds were critical for occupational success and nepotism and favouritism were prominent features in the recruitment and promotion process. It is obvious from the fact that after 15 years of government ownership and management of gold mines, the rigid occupational structure created by the British remained much the same. In 1971, 9 out of 10 officers were Brahmins, and 10 out of 10 miners were ADHs and ADCs. As the accompanying Table (based on a sub-sample of 281 Hindus only) suggests, in KGF one's caste tends to determine one's class.[6]

Following nationalisation there emerged aggressive trade unions, especially the ones led by the Communist party. Several welfare measures were introduc-

Percentage Distribution of a Sub-Sample of 281 Hindu Respondents Showing Caste and Class Convergence

(Caste) Varna	N(per cent)	Class Lower	Middle Class	Upper Class
Brahmin	52(18.5)	4(7.7)	28(53.8)	20(38.5)
Kshatriya	12(4.3)	10(83.2)	2(16.7)	—
Vaisya	25(8.9)	15(60.0)	7(28.0)	3(12.0)
Shudra	58(20.6)	31(53.5)	22(37.9)	58.6)
Panchama	134(47.7)	115(85.8)	18(13.4)	1(.8)

al — schools, medicare, accident benefits, gratuity and so on. But these were a pittance relative to the emoluments of workers elsewhere and, of ourse, to the prosperous officials and white collar classes. In 1971, the difference in the mean salary of a miner and a clerk with comparable period of service was roughly Rs 450 and between miner and an officer was roughly Rs 1,100 (excluding perks). The widening gap in income was set in motion by the British and none, apparently, was able to halt it let alone reverse it. The demands for salary increases have not been met yet, mainly because gold mining is no longer profitable and any trade union pressure by way of strike and so on would lead to an easy solution — closure of the mines, a dreadful prospect as far as the miners are concerned. Ironically, when there was a salary dispute between the Government of India and officers in 1965, the officers threatened mass resignation and government yielded to their demands. Besides, in the recent history of the mines, few officers have been retrenched but the retrenchment of workers has been going on for about 20 years.

There were two important developments in the 1960s which gave some relief to workers' families. First, a college was founded at the initiative of local politicians and trade union leaders in 1960. Initially about 90 per cent of the students of this college were from the gold miners' families. In a way the *KGF College opened up opportunities* for educational training which, in turn, led for the first time to occupational mobility for many. Second, the establishment and progressive expansion of Bharath Earth Movers Ltd (BEML) in the late 1960s came very handy for the graduates of KGF College. Today roughly 60 per cent of BEML clerical staff are children of miners who graduated from KGF College. But again such opportunities appear to be short-lived. Other than BEML (which has peaked its development now) there are very few openings for miners' children. True, they have degrees but they do not have additional qualifications such as political or other kinds of influence essential for job placement these days. As a result, today only a fraction of the graduates from KGF College have been able to find employment. The rest are with their parents constantly reminding them of their failure, and the continued failure of the society to give them their due.

Present Situation

In 1972, the Kolar Gold Mines, which operated as part of the Finance Ministry became a Corporation — Bharat Gold Mines Ltd (BGML). While this transformation did not usher in greater benefits to the workers it changed the fortunes of the neo-colonial officials whose positions of privilege had continued for roughly two-and a half decades. The Government of India was arguing since 1965 that the perks and the emoluments given to the gold mines officers were unprecedented and unparalleled. Yet it was unable either to retrench them or to cut down their income. After prolonged negotiations and arbitration the legal basis of jobs or positions became contract period, the employee could quit or could be denied renewal.

But this option was not exercised on either side mainly because the Government of India did not have the courage to terminate the services of an official as this would result in mass resignation, and officers themselves would not ruit as long as their comfortable positiion were not tampered with. When K V Subramanyam took over as the Chairman-Managing Director of the newly-formed BGML, he saw the disparities between the officers and the workers. Within two years he progressively retrenched senior and junior officials, did not renew contracts of those which came up for renewal — and this he did it with all the legal and administrative finesse he could command. The officers could no longer threaten mass resignation. Further, he obliterated all the colonia institutions such as exclusive clubs, golf courses and so on. Huge bungalows were converted into smaller flats and officers had the choice of either staying there or finding housing elsewhere. The consequence of such a move has been that most senior officers have either been retrenched or have quit. But even these measures have not altered the miners' lot in any recognisable manner.

In conclusion, the present generation of miners are victims of a system of institutionalised inequality which was thrust on them by the Britishers and assiduously mainained by their successors. One may understand the British policy as part of their colonial and imperialist strategy but the attitude and approach of the Indian officers and the government towards miners are despicable beyond imagination.

Notes

1 I have discussed at length the residential segregation in KGF based on caste and class in my book, "Family and Cast in Urban India, a case study", Vikas Publishing House, Delhi, 1977. See Chapter VII.

2 See G N Ramu, 'Migration, Acculteration, and Social Mobility among the Untouchable Gold Miners of South India', *Human Organisation*, 30 (2), 1971.

3 See Paul D Wiebe and G N Ramu 'Christian and Hindu Harijans Christian Programmes in India as Agents of Social Change', *Eastern Anthropologist*, 28 (3), 1975

4 The Kolar Gold Mines were actually nationalised in 1956 (not in 1947, as Mathew says) when K Hanumanthaiah was the Chief Minister of Mysore. In 1962 the mines were handed over to the Finance Ministry of Government of India. While the transfer of ownership did not alter the bureaucratic structure, the overall supervision was left to a senior IAS official who acted as the Managing Director

RURAL EMPLOYMENT: FACTS AND ISSUES

A PRIMER FOR AID RECIPIENTS

AGRICULTURAL ECONOMY OF KUMAON HILLS

VICTIMS OF GREEN REVOLUTION

FLOOD THREAT TO COAL-MINES

NEW PERSPECTIVE ON ENERGY POLICY

Sundaram Finance: where the going is good on your goodwill.

Established in 1954, with a capital of only Rs. 2 lakhs, Sundaram Finance today is a widely held Company and the largest hire-purchase Company in India. Its phenomenal success stems from the goodwill earned through its traditional, 'total commitment' service. On its Silver Jubilee, Sundaram Finance, being more at home with figures than with words, can think of only two words to express its deep gratitude to you: 'Thank You'.

Right at the outset, we took a pledge: total commitment to customers.

25 years since, there has been no shift in this corporate policy

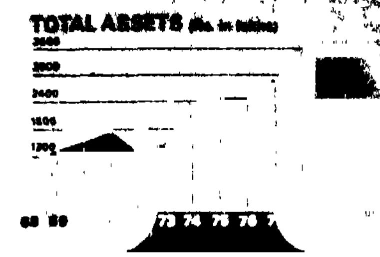
Service that means much more than finance:

Our administrative procedure is simpler. We ensure quick availability of finance We allow extended repayment periods and provide technical services And we always keep our finance charges reasonable

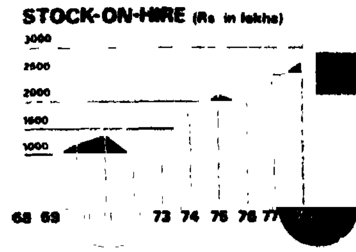
A little big push for the auto industry:

In recent years, we have reduced our finance charges substantially The result? An increasing number of transport operators have been able to secure for themselves vehicles of their choice on reasonable terms and a steady income in the process,

We, at Sundaram Finance, feel privileged to have been associated with the highly employment-oriented road transport industry, contributing to its faster growth.



Your goodwill – our biggest asset:



Although we are constantly striving to play our role in the growth of the transport industry we never forget that our success is largely due to the tremendous trust and goodwill you have reposed in us.

Today, we have over 6,000 customers on our books Many of them, for well over a decade. And over 15,000 members of the public have deposited their savings with us

As we complete 25 years of service, we renew our pledge that we will serve you to the best of our ability in the years to come

On this occasion, we can only think of just two words ..**'Thank You'** for the splendid support you have given us to make the going so good

[illegible]id [illegible] [illegible]ustrialisation?

The meeting of the Aid-India Consortium at Paris earlier this month has been made to appear as an unqualified success for aid-givers and aid-receiver [illegible] W David Hopper, vice-president of the World Bank for Asia, was [illegible] doubt speaking for all the members of the Consortium when he said, after the meeting, that the World Bank had "nothing *but absolute approval for* India's strategy for development". And, as a just reward for such good conduct, the members of the Consortium were pleased to commit $ 3 billion in aid to India in 1979-80, without taking account of the likely contributions of UK and Canada, where new governments have only just assumed office and so were not in a position to make a formal commitment yet. Even if these two countries do no more than maintain their aid commitments at last year's level, total Consortium aid committed to India this year will be $ 3.4 billion, compared to $ 2.4 billion last year. India's aid diplomats can congratulate themselves on having achieved these excellent results. For, strictly speaking in terms of need, India's case for aid this year was a weak one since, for the fourth year in a row, there was a sizeable increase in the country's foreign exchange reserves in 1978-79. These reserves, excluding gold and SDRs, are currently well over Rs 6,000 crores.

The Indian officials' case for larger aid from the Consortium this year was based mainly on the expectation of a series of misfortunes overtaking the Indian economy in the near future. Among the dire possibilities highlighted were that the country's import bill would go up sharply on account of further increases in the prices of crude petroleum and petroleum products, that inward remittances from Indians employed abroad, which have been largely responsible for the accumulation of foreign exchange reserves, might taper off, and even that the agricultural situation might change so drastically for the worse as a result of monsoon failure that once again the country would need large-scale imports of foodgrains. The large trade deficit of Rs 1,062 crores in 1978-79 (despite which, however, there was a further accretion of Rs 720 crores to foreign exchange reserves during the year) was used to give a touch of credibility to these forebodings. Apparently, the World Bank and the other members of the Consortium had no difficulty in accepting that India might face a more or less grave balance of payments crisis very shortly and, on that ground, agreed to continue large-scale aid to this country, despite the current comfortable foreign exchange position.

However justified these prognostications of impending disaster may be, the central issue in the relationship between India and the aid-givers just now is an altogether different one and it seems to have been scrupulously avoided by both sides at the Paris meeting. This is quite simply that India's ability to absorb aid, as judged from the actual experience of the last few years, does not justify aid commitments on the scale proposed by the Consortium. According to the Explanatory Memorandum to the 1979-80 Budget, net external assistance (net of repayment and interest payments) in 1978-79 was just Rs 588 crores which was virtually one-half of the original budget estimate of Rs 1,115 crores. And the budget for 1979-80 starts in the first place with an estimate of only Rs 878 crores of net aid utilisation in the current year. The Secretary to the Department of Economic Affairs, who was India's chief aid negotiator at Paris, himself admitted that aid utilisation as a proportion of aid in the pipeline was likely to decline from 25 per cent last year to 19 per cent this year. Unused aid in the pipeline went up from Rs 2,878 crores at the beginning of 1978-79 to Rs 3,840 crores at the beginning of the current financial year.

This is not surprising. The experience with regard to aid utilisation is all of a piece with the overall performance of the economy, the outstanding feature of which has been the failure to use for investment and growth available resources in the form of large stocks of 'surplus' foodgrains, under-utilised capacity in many capital goods industries and growing foreign exchange reserves. Despite the existence of these resources, investment has failed to pick up. Outlay on the Central Plan in 1978-79 is known to have fallen short of the target of Rs 5,664 crores by about Rs 300 crores. In fact, given the sharp rise in prices of most investment goods, the shortfall in real terms is bound to have been much larger than that indicated by the lower financial outlay. For instance, in the power sector, to which so much importance is currently attached, the additional generating capacity commissioned in the first 11 months of 1978-79 was only 1,952 MW as against a target of 3,872 MW for the whole year. And the increase of a little over 7 per cent in the total Plan outlay of the Centre and the states proposed

for 1979-80 will, even if achieved, be more than neutralised by the rise in investment costs.

The government has managed to step up the utilisation of foreign exchange resources to some extent, not so much in a planned manner for development, but by relaxing import controls so that imports have gone up in response to market demand. Larger imports have also been necessitated by the relative stagnation in the output of a number of major industries like iron and steel, cement, etc. In fact, in the calendar year 1978 the entire capital goods sector of industry showed an increase in production of only 2.7 per cent. On the whole, imports went up by nearly Rs 800 crores or a little over 13 per cent in 1978-79.

However, even allowing for easy import of a wide range of products and also assuming continued low growth of production of a number of domestic industries, there are limits in the short run to how far a policy of import liberalisation can bring about a rise in imports and so make possible larger utilisation of foreign exchange resources, including aid. On the one hand, a number of structural constraints — principal among them, the highly skewed distribution of income and wealth which severely limits the size of the domestic market and the significant degree of oligopoly and concentration of market power in large-scale industry which restricts the pace of investment and capacity creation in response to even such expansion of demand as does take place — result in the failure to use available foreign exchange resources, including aid, for stepping up investment and growth. On the other hand, over the nearly three decades of attempted planned development with a good deal of the accent on import-substitution, a domestic industrial structure of sorts has been created for consumer as well as capital goods. It is true that a significant part of this industrial structure is controlled by foreign capital; an even larger part of it is dependent on foreign technology; and the gross inadequacy of indigenous research and development and technological advance has rendered most industries 'backward' compared to those of the industrialised countries. Nevertheless, even the limited extent of industrialisation that has taken place does mark India out from most other so-called developing countries. And this industrialisation does limit the possibility of massive expansion of imports of the type that other countries, without comparable domestic industrial development, have been able to effect with the help of aid.

This is not, of course, an unchangeable situation. A prolonged enough period of low investment and low additions to industrial capacity, together with a regime of progressively liberal imports, can whittle down the industrial structure which has been created so far. With that, resistance from domestic industry to larger imports will also wear out. Already, the rates of growth of industrial capacity in the seventies, especially in the major basic and capital goods sectors, have been far below those achieved in sixties. Massive foreign aid, by inducing and underwriting liberal import policies, can certainly accelerate this process. The large aid committed by the Consortium, which is clearly unusable and therefore quite meaningless in the short run, makes sense if it is seen as likely to secure this sort of de-industrialisation of India in the long run.

Congress Party

Another Parting of Ways

THE clash of interests between Indira Gandhi and Devaraj Urs began almost on the heels of the triumphant return of Devaraj Urs to power in early 1978, after his government had been dismissed following the split in the Congress organisation. For, after her own humiliating defeat in the 1977 polls and the equally poor showing of the party in the elections to the state assemblies in June 1977, the victory of the Congress (I) in the South, particularly in Karnataka, could not be seriously attributed to the alleged 'charisma' of Indira Gandhi. The repeated and straight-faced affirmations by Urs that he considered himself to be merely a loyal footsoldier in the army of Indira Gandhi served to rub salt into the wound; and the fact that Indira Gandhi had no option but to seek Urs's help in getting elected to the Lok Sabha from Chickmagalur could not have endeared him to her at all.

But to explain Indira Gandhi's attempts to politically destroy Devaraj Urs in purely personal terms and see it as yet another instance of Indira Gandhi kicking away the ladder she used to climb higher (the list of her victims is long) is to miss the political meaning of such breaks and it is to give undue credence to the claims of Devaraj Urs that he, personally, helped in the political rehabilitation of Indira Gandhi. Indira Gandhi's 'ingratitude' has nothing unique about it, for it conforms entirely to political behaviour; her need of Devaraj Urs has been almost as much as Urs's need of her, and if she was preparing to discard Urs, it was equally clear that he has had been preparing to discard Indira Gandhi.

A refreshing aspect of the Karnataka developments and the related developments in the Congress (I) is that the protagonists have not cared to garb their public posturings about what caused the split with any 'principles'. The publicly mentioned issue that is supposed to have caused the final break is the refusal of the Karnataka chief minister to agree to the suggestion that he should step down from the PCC(I) presidentship and allow a nominated successor to occupy that position, and, later, the defiance of the formal CWC (I) resolution dissolving the KPCC (I) and replacing it with an *ad hoc* body. Urs has naturally made much of his 'principled' stand against such 'ad hocism', claiming to be the democratically elected president of a democratically constituted body. But these public posturings equally transparently conceal the more obvious contentious issues — Indira Gandhi's anxiety that Urs may make a deal with the Central leadership of the Janata party and thus balk at going the whole way in fighting her personal battles against the Janata government and Urs's opposition to the not quite invisible impact of Sanjay Gandhi on Congress (I) politics.

Devaraj Urs has claimed in his letter to Indira Gandhi that it was only due to the baleful influence of Indira Gandhi that many Congressmen have been "driven into oblivion or into antagonistic camps" and that the time has now come for them to "re-assemble and reconstruct the Congress house once again out of the debris" left behind by Indira Gandhi. Clearly, the kind of realignment of forces that Urs and his like-minded friends are contemplating is quite a different kettle of fish from the one that is being promoted by the CPI and its like-minded friends in the Congress and the Janata. For, whatever one may accuse Devaraj Urs of, one cannot accuse him of being in any way a heretic to the Congress tradition; indeed, much effort was spent by him last year in striving to unite the two Congress factions — no doubt as part of his larger plan to

secure his own position in any future confrontation with Indira Gandhi. Those efforts failed but, as is now apparent, Urs did not cease in his search for an alternative arrangement. These exertions of Urs and Indira Gandhi's counter-exertions to deny him such an alternative political base outside Karnataka could not but lead to the parting of ways.

What is however notable about this parting is that for the first time Indira Gandhi has had to take the initiative and throw Urs out. In both 1969 and 1978, Indira Gandhi had managed to make her opponents appear like evil men, out to crush her; it was always she who (formally) 'walked out' of the party, all the while of course claiming tha she continued to have the loyalty of the majority of Congressmen. But in the present instance, at least tactically Devaraj Urs appears to have outmanoeuvred her by arranging things in such a way as to enable him to appear in the role of the victim.

Corporate Sector

Blessings of Bigness

THE Reserve Bank has just released the summary results of its study of the performance of large public limited companies in the private sector (each with a paid-up capital of rupees one crore and above) in 1977-78. The study of these 415 large companies (which form a part of the Reserve Bank's larger sample of 1,650 medium and large public limited companies in the private sector) reveals, among other things, the extent of concentration in the corporate sector. The value of production of these large companies amounted to as much as Rs 11,297 crores in 1977-78. The total capital employed in them (gross fixed assets, inventories and other capital) was about Rs 13,000 crores. These large companies accounted for 72 per cent of the value of output and 75 per cent of the gross fixed assets of the 1,650 companies (based on the results for 1975-76). In terms of growth, the large companies have always performed better than the medium and small ones. The plethora of company laws and other regulations created to protect the smaller companies and to bring about a change in the structure of the corporate sector in their favour thus seem to have hardly helped matters. The largest companies have always had an edge over the others, whether in respect of growth of assets or growth of sales or profitability. For instance, in 1975-76, growth of sales of the large companies in the private sector was 14 per cent, while that of the medium and large companies taken together was 11.5 per cent. The corresponding rates for gross asset formation were 10.4 per cent and 9.2 per cent. Likewise, the ratios of profits after tax to net worth were 10.2 per cent and 8.2 per cent, respectively.

The data for the bigger sample of 1,650 companies have not been published for the years beyond 1975-76, but it is known that the profitability of the corporate sector in general has not been buoyant since then. But, in regard to the largest public limited companies, this does not hold true; their profitability has apparently been maintained. Their gross profits as a proportion of total net assets were 11.3 per cent in 1975-76, 11.6 per cent in 1976-77 and 11.3 per cent in 1977-78. Profits after tax as a percentage of net worth were 9.9 per cent, 9.8 per cent and 9.7 per cent, respectively. Even this fractional decline must have been due to slightly higher growth in paid-up capital in respect of many FERA companies which have had to increase their share capital for purposes of so-called Indianisation.

It is also interesting that the tax burden on the large companies in 1977-78 was relatively lower than in the previous year and also lower than the growth in pre-tax profits, which has resulted in considerable increase in these companies' post-tax profits. Their profits before tax (PBT) had risen by 5.5 per cent in 1976-77 from Rs 665 crores in 1975-76 to Rs 701 crores and further by 4.6 per cent in 1977-78 to Rs 733 crores. But tax provision made by these companies, which had risen by 6.1 per cent in 1976-77, rose by only 2.9 per cent in 1977-78. Tax provision as a proportion of PBT declined from 54.2 per cent to 52.3 per cent. This reduction in tax burden is apparently the result of the tax concessions extended in the 1977-78 budget to the companies sector. Important among them were, (a) enlargement of the scope of investment allowance to all industries except those engaged in specified low priority areas; (b) grant of higher investment allowance at 35 per cent on plant and machinery installed for production based on new knowhow developed in India; and (c) provision for voluntary amalgamation of sick industrial units with sound ones with facility to set off losses against the latter's profits.

The rate of growth of gross fixed assets of the large public limited companies has improved; it was 8.4 per cent in 1976-77 and 9.5 per cent in 1977-78. Earlier, the rates of fixed assets formation had been 10.2 per cent in 1974-75 and 10.3 per cent in 1975-76. On the other hand, the CSO's estimates of gross fixed capital formation for the entire corporate sector showed a very steep decline from 1975-76 to 1977-78, from Rs 2,002 crores in 1975-76 to Rs 1,405 crores in 1976-77 and Rs 1,525 crores in 1977-78. This again suggests that assets formation in the largest companies has been higher than in the rest of the corporate sector.

There was also a higher inventory carryover in 1977-78 — a growth of 4.8 per cent in inventories compared to only 0.7 per cent in 1976-77. According to the Reserve Bank, "inventory accumulation took place mostly in the form of raw materials, components, etc, the stock of these having increased by 6.5 per cent over the year". A more noteworthy aspect relates to the financing of inventories. There was a pious hope that with the implementation of the Tandon Working Group's recommendations, the use of bank finance for holding inventories would decline so that there would be a better turn round of scarce bank funds. Instead, quite the contrary seems to have happened. Earlier, for large public limited companies, the share of short-term bank borrowings in the holding of inventories had declined from 54.7 per cent in 1970-71 to 41.2 per cent in 1974-75. This was partly due to the stringency of monetary controls; partly this was also a period when the large parties had managed to pass on the incidence of credit shortage to smaller companies by increasing their reliance on trade credit. 'Sundry creditors' as per cent of 'sundry debtors' had shot up from a little over 100 in 1970-71 to 138 in 1974-75. Thereafter, there has been a steady increase in the percentage of short-term bank borrowings to total inventories, from 41.2 per cent in 1974-75 to 47.8 per cent in 1975-76 and further to 50.2 per cent in 1976-77. In 1977-78, despite better profitability and the Tandon Working Group's recommendations, dependence on bank finance for inventory build-up remained at 50.3 per cent, the level which was prevailing at the beginning of the seventies. Even 'sundry creditors' as per cent of 'sundry debtors' increased from 108 in 1976-77 to 112 in 1977-78, with the result, as the Reserve Bank review points out, that "the selected companies continued to be net absorbers of trade credit in the

year under review". Even the ratio of current assets to current liabilities declined fractionally from 1.30 to 1.28.

The growing dependence of the large companies on borrowed capital is evident also from the rising debt-to-equity ratio. According to the study, "debt as percentage of equity maintained an uptrend from 45.3 per cent in 1975-76 to 46.6 per cent in 1976-77 and further to 48.2 per cent in 1977-78". Incidentally, the concept of debt used in this country is peculiar in that it excludes all short-term borrowings which as it happens are as large as, or even larger than, long-term debt. Hence the debt-equity ratio should really be reckoned, even in respect of the corporate sector as a whole (including the older companies), at 1:1 or more.

Lastly, despite the larger dependence on borrowed capital, 'interest cost' as a percentage of value of production remained at 3.6 in both 1976-77 and 1977-78. Also, "the ratio of interest paid during the year to the average of outstanding borrowings at the beginning and at the end of the year, which may be taken as a rough estimate of the average cost of borrowings, was marginally higher at 12.6 per cent against 12.4 per cent". Thus, despite all the talk of dear money, the average rate of interest charged on companies' borrowings works out to only 12.6 per cent and even of this a little more than half is borne by the government as interest cost is a deductible expenditure for tax purposes. The scheme of taxation and the low interest rate policy have created a definite bias in favour of loan capital and against risk capital.

Sugar

Unwanted Control

CONTROL on monthly release of sugar was reintroduced by the Central government on June 4. The step was hailed by the Maharashtra Rajya Sahakari Sakhar Karkhana Sangh. This is understandable. It was pressure from co-operative factories in Maharashtra and all over the country to prevent an alleged slump in sugar prices which had persuaded the government to allow the sugar industry to launch the system of voluntary release of sugar for sale each month. The voluntary release arrangement was used by industry to restrict the availability of sugar coming to the market and the result was that prices rose by Rs 40 to 50 per quintal. There was a hue and cry from the press and public which compelled the government to reintroduce an element of official control on the quantity of sugar released for sale every month. Industry, realising that its game of voluntary releases had been seen through, persuaded the trusted bureaucrats of the Sugar Division of the Union Food Ministry to bring monthly releases under government control.

There is in fact no case whatsoever for any regulation of sugar releases, whether administered by the industry or the government. Given the present position of output and stocks, there is little likelihood of prices moving up and certainly not during the monsoon. By its very nature, sugar deteriorates rapidly and damaged sugar has to be disposed of at throw away prices. Traders too reduce their inventories to the minimum. So the main burden of carrying the large stocks falls on industry. With godowns bursting with sugar and the industry faced with three months of poor demand for sugar, the real problem is one of maintaining the price level.

Incidentally, some four decades ago prices of first class gur were at least 40 per cent below those of average quality sugar. However, during the last few months gur has been selling at prices higher than those of sugar. For example, Kolhapur extra quality gur is selling around Rs 3.25 per kg in Bombay, while sugar D-30 is selling at Rs 2.80 per kg or a little less.

There is, on the whole, little reason to complain about the level of sugar prices in the current season. What has to be guarded against is that industry may succeed in getting the price raised to Rs 3.30 per kg, which it has already demanded.

Assam

Who is to Guard the Guardians?

Seema Guha writes:

THE Public Accounts Committee of the Assam legislative assembly, in its 30th Report, has brought to light many instances of widespread corruption in the state's police department. The most interesting of these involves the Special Branch of the Assam Police.

The report reveals that 52 Inspectors of the Special Branch had systematically cheated the state government of approximately Rs 1.27 lakhs by drawing double pay, in the period between December 1970-February 1974. These inspectors who were posted at different districts first drew their pay and allowances in their respective places of posting. Later, when they were transferred to their headquarters in Shillong (Meghalaya was still a part of Assam till 1971), they submitted fresh pay bills for the same period to the Shillong Treasury. The Report also finds instances of police officers who had retired from service still drawing full salary; of two men who were no longer serving the Assam government (one of them transferred to the Centre and the other in the Meghalaya cadre) but claiming and receiving their salaries from the state government.

How did these police officials receive such 'double benefits'? Police Inspectors are not gazetted officers, and their pay bills have to be countersigned by their superior officers. In the districts the signature of the superintendent of police is required, while in the headquarters either the DIG or any of the three SPs attached to the office countersigns them. Apparently, neither the DIG nor any of the SPs had the slightest inkling of the organised swindling that was being operated under their very noses, for these 'responsible' high officials had been signing their stamp of approval over false pay bills for four whole years.

The fraud was first detected in the Accountant General's audit report for the year 1972-73. A case was filed against the two civilian accountants working in the Special Branch, and both of them were suspended. But significantly, the Inspectors involved have not been touched, and are still performing their normal duties. In fact, as the proceedings of the cross examination of the official witnesses by members of the PAC revealed, the Inspectors were not even required to forward any explanation for drawing double pay.

The case which was registered in August 1974 has not yet been completed. The excuses put forward for this delay have been varied. One reason put forward for the slow progress of the case has been the shortage of investigating staff in the Meghalaya CID. (The case was investigated by the Meghalaya police.) Another reason is that seizure of documents and examination of officers from the state government and the Shillong Treasury have not been completed. Yet another reason is that the investigating officer has not yet been able to collect the specimen signatures of some of the Inspectors and other officers involved for verification by handwriting experts.

The Meghalaya police certainly seem to be dragging their feet over this case, probably because police personnel are involved. Assam and Meghalaya police worked as a single unit till 1971, and most of the men involved have friends and colleagues in the Meghalaya cadre. So far the Special Branch seems content to let the civilian clerks shoulder all responsibility for the fraud, though the PAC investigators held the treasury officer and one of his colleagues in the Shillong Treasury *only* partially responsible for the misappropriation. But even here no case has actually been filed against the treasury officer and his colleague.

Investigations against the senior police officers who countersigned the bills (one DIG and three SPs) could not be completed for want of records. Yet, in the course of the PAC investigations, it was learnt that since 1970, the office of the Special Branch have been maintaining a monthly register where office expenses, including salary paid to the office personnel, is recorded. This register is checked and countersigned by responsible officers. It has been found that while in some cases there has been double countersignatures, in many cases no signature is found against a particular payment. In fact some payments have not even been entered in the register.

Meanwhile the PAC has observed that "the matter which could be done easily within a short span of time is delayed on one plea or other due to negligence on the part of the department". It has requested the Meghalaya government to complete investigations within three months of the date of presentation of this report before the House.

One interesting aspect of the revelations of the PAC Report has been that this case of gross corruption by the guardians of 'law and order' has not even been properly reported in the local press which has generously decided to brush the scandal under the carpet.

Pakistan

Seeking Parity

INDIA has expressed "great concern" at Pakistan's efforts to acquire nuclear weapons capability, and is reported to have tried to persuade the United States to use its influence and ensure that Pakistan would not start a nuclear weapons race in the region. These anxieties have been sharpened following the 'leak' by the US administration that Pakistan has indeed been building a uranium enrichment plant with equipment secured in a variety of open and clandestine ways, and that once the uranium enrichment plant is complete, an experimental nuclear blast will duly follow. Nothing can prevent Pakistan from utilising the enriched uranium to have its own 'Pokhran', to be followed by a possible nuclear weapons programme as well.

The Indian 'concern' would have been more credible and would have attracted greater sympathy from other countries had India not itself been engaged in a nuclear programme with obvious nuclear weapons implications. But of course, what New Delhi wants other countries to believe is that while its own nuclear programme is entirely peaceful in nature, a corresponding Pakistani programme has to be, by definition, war-oriented; that while India has rejected any international inspection of its nuclear facilities on the ground that such inspection would be discriminatory, Pakistan's willingness to subject all its nuclear facilities, existing or to be built, on a 'non-discriminatory basis' to all non-nuclear weapon states or to states in its proposed nuclear weapons free zone in South Asia is 'not adequate', which is how India's permanent representative at the UN described the Pakistani proposal when it was made in the meeting of the UN committee on the Indian Ocean.

Behind such high-minded 'concern' lies the conviction that India is, and has always been, the most peace-loving state in the region It is difficult to blame Pakistan if it cannot entirely agree with such self-assessment of India's peaceful intentions; and even objective observers would be hard put to deny that such a reading of the India-Pakistan relations is not even strictly true. In fact, Pakistan's building of the uranium enrichment plant — that it is being clandestinely built cannot be held against Pakistan, for such clandestine activities are a universal feature of nuclear programmes of any country — and the now inevitable explosion that will follow in due course are causally related to India's own nuclear programme, including the Pokhran explosion in 1974. And even as India has been reiterating that it has no plans at all to go in for a nuclear weapons programme (though the Pokhran explosion made sense only militarily), Pakistan too has categorically denied that its peaceful nuclear programme has behind it any intent or purpose of developing nuclear weapons and that "the aim and orientation of the programme are directed solely towards peaceful ends".

The point is not whether the government of India or the government of Pakistan are being entirely truthful when they claim that the explosion of a nuclear device or the building of a uranium enrichment facility is directed towards peaceful ends; what is more relevant is that the claims are voiced almost in identical language, and the government of India cannot assume a *holier-than-thou attitude* in seeking to attribute to Pakistan's nuclear programmes, aims and intents which cannot be, with equal justice, attributed to the government of India itself. Given the nature of India-Pakistan relations, after Pokhran a Pakistani nuclear weapons programme became inevitable, and the present regime has only been continuing the work begun by Zulfikar Ali Bhutto who had vowed that even if the Pakistani people had to eat grass, Pakistan would have the bomb.

A curious feature of these revelations about Pakistan's nuclear programme is that its details have become available following a deliberate leak by the CIA. Apparently, these details were put together by the CIA as well as other security agencies of several European countries. For long official propaganda in India has made any regime in Pakistan a virtual creature of the CIA; according to this view, while the best traditions of parliamentary democracy were being scrupulously followed by India, Pakistani regimes were successively headed by military and bureaucratic cliques — precisely the kind of coteries which the US could entice into various military pacts directed against democratic India. Hence, it is curious that this top secret Pakistani programme whose aim is no more and no less than seeking parity with India in the nuclear programme, including nuclear weapons programme, and which should have fully met with the approval of the United States, should have been leaked to the outside world by the US administration itself. Perhaps, the West is more concerned with the possible implications of the Pakistani programme to the security of Israel than its implications to the security of India. The sharp and immediate official response by the US to Pakistan's nuclear plans — the cutting off of all development aid — does contrast with the relatively mild reaction by the same US administration to continued Indian refusal to allow its nuclear options to be curtailed. —

External and Internal Horizons

Romesh Thapar

PRIME MINISTER Desai's junket through the Communist world is highlighted by the discussions in the Soviet Union and Yugoslavia. The problems of the region around India, made tense by the Afghan charge that Pakistani soldiery is playing with tribal rebellions, and the wider role of the non-aligned movement now sought to be polarised by the "friends" of the Arabs and of Cuba, will be settled broadly within the frameworks evolved by New Delhi. India speaks from what might be termed a position of strength, and is not to be scoffed at.

Be that as it may, I hope someone is constantly telling our dear Prime Minister that he should not get carried away. In every capital of the world, the government of Morarji Desai is seen as something which will just about last until the general elections of 1982. It is seen as a continuer of old policies, trying very hard to fraternise with the US, but being forced by events to fashion more solid working relationships with the USSR. The Islamic bomb, or whatever it is that Pakistan is putting together, heavily underlines this.

The inevitable contradictions in external alignment which are emerging, and which will arise, provide considerable power of harassment to the critics of the present Janata party set-up. If it had been a matter concerning only the fulminations, usually half-baked, of Indira Gandhi and her confused followers, Atal Behari Vajpayee alone could have taken care of them. But, today, the danger of informed sniping from within the ruling party is more urgent. Such attacks, encouraged by various lobbies, but mounted by parties interested in internal political advantage, could de-link our foreign policy from national interest and throw it into growing disarray. After all, this is happening in other equally important areas.

If Morarji Desai is refreshingly independent in his talks with the leaders of other countries — a style he developed even as far back as when the Shah ruled in Iran, and to whom he delivered a forty-minute lecture on intelligent statesmanship when rebellions threaten! — the fact remains that he knows that these are the last gambits left to him. The current story that he is evolving his own foreign policy line over the head of Vajpayee is nonsensical in the context of Janata party equations. Lines evolve these days because they represent some sort of consensus, willing or unwilling. It is this state of affairs which excites the manipulators of policy within the ruling party.

Meanwhile, with Indira Gandhi solidly working for the mismanagement of her political future, and Congressmen looking around desperately for new alignments which will make sense in 1982, it is becoming apparent that the old men of the Janata party (Jagjivan Ram and Charan Singh) are no longer seen in any future scenario of political change. The persons who are coming into increasingly sharper focus are Chandra Shekhar, Bahuguna and Limaye. Each is espousing policies and postures designed to strengthen the prime minister potential of his image.

Chandra Shekhar zealously builds the impression of an arbiter, a federal consensus-maker, clean and straightforward, without a base of his own. If the rough and tough politicians who predominate in the legislatures see him as a dilettante, non-serious and lacking organisational capacity, there is always the Young Turk record available for reference. His Congress connections are sought to be supplemented by his accommodation of the Jana Sangh/RSS — and, of course, there is that bit about being JP's heir. His policy pronouncements are few and far between, and that goes for foreign policy where he is careful not to offend the susceptibilities of any group. A comfortable coalition? That's the aim, and it can have a wide stretch.

Bahuguna is playing what appears to be a deeper game of power. To him, Uttar Pradesh is still the lever for prime ministership. Once again, he is active in UP politics, and unencumbered by Jagjivan Ram's calculations in the Hindi heartlands. Bahuguna believes that his credentials among Muslim and Harijan voters are excellent, and that then all it improves as he builds his linkages with Urs in Karnataka, with Pawar in Maharashtra and with the coalitionists in Kerala. After all, he has a working understanding with Communists and leftists of various hue. Here, too, there is a reluctance to be involved in policy and programme, those politically troublesome matters. A second to Urs? May be. For a while, if necessary. A revived Congress? Yes.

Only Limaye pushes on the front of ideology. It is difficult to assess him. He is no simpleton, even as he spouts a Soviet line surrounded by CPI activists. Clearly, he is searching for a short-cut to a position of continental leadership. The programmatic filibuster within the Janata party clears him of involvement in the mess of today and, with the careful use of the Soviet connection, he is able to link with diverse elements all over India. Normally, a tactic of this kind has proved the kiss of death, but Madhu Limaye is unconcerned. A second to Bahuguna? Not really. To Chandra Shekhar? Certainly not. A left front? Why not?

If the CPI(M) in Bengal had not suffered so grievously as a result of the present chaos in that state, the calculations of the three younger contenders in the Janata party would have been more complex. But that prospect of a CPI(M) revival is not to be ruled out, despite the total failure of the CPI(M) to create a mass response to the challenges facing Bengal. Then, if they wanted to survive politically, Chandra Shekhar, Bahuguna and Limaye would have to spell out what they claim to stand for. Such a moment would bring the moribund Janata party face to face with its real failing — no time-bound programmatic action.

India is a sad case. Even the pretence of thinking about the country is no longer considered necessary. The political leadership of every party seeks personal salvation. If Morarji Desai survives, it is because the many contenders for power cannot agree among themselves who should replace him. But, sooner or later, the decision will be forced. And what a prospect. Prices breaking barriers. Production in chaos. An administrative paralysis. Rampant corruption. And law and order becoming a matter of personal whim or fancy. Reading the newspaper these days is an exercise in patience.

June 16

Lower Sales, Higher Net Profit

Hansavivek

BARODA RAYON continues to expand. It is going ahead with its nylon tyre cord project. Most of the imported machinery and equipment has arrived, and orders for indigenous equipment are being placed. Civil engineering work has commenced and the plant is expected to be commissioned in two years. The polycondensation plant for conversion of DMT into polyester chips, commissioned during the last quarter of 1978, has been functioning normally. The programme of modernisation of plants is in progress. It is aimed at raising capacity for rayon from 3,000 tonnes to 4,500 tonnes per annum, and of nylon plant from 1,740 tonnes to 2,436 tonnes is in progress. The company has received a 'letter of intent' for increasing capacity of sulphuric acid plant from 14,000 tonnes to 21,600 tonnes per annum. Its capacity for annual manufacture of 1,980 tonnes of carbon-di-sulphide has been recognised by the government. The company has produced impressive results for 1978. Production of rayon filament yarn was 3,773 tonnes against 3,729 tonnes in the previous year; that of nylon filament yarn 1,745 tonnes against 1,670 tonnes; and of polyester filament yarn 677 tonnes against 472 tonnes. Net sales were slightly lower at Rs 26.42 crores against Rs 26.78 crores, but gross profit increased to Rs 8.09 crores from Rs 5.45 crores showing a 48.4 per cent advance. Net profit is Rs 6.01 crores (Rs 3.84 crores) and dividend stepped up from 10 per cent to 12 per cent is covered 5.61 times against 3.84 times previously. This outcome has resulted from a combination of favourable factors — upsurge in demand for the company's products, reduction in the cost of caprolactum (the main raw material for production of nylon yarn), introduction of special yarns in nylon and polyester, higher production of polyester filament yarn, and lower cost of finance because of reduced borrowings. The company experienced shortage of coal and had to move substantial quantity of coal by road at higher cost because of shortage of wagons. The directors complain that the burden of excise on nylon and polyester yarn has been systematically raised in successive budgets and now works out at almost 105 per cent of the net ex-factory price.

DUPHAR-INTERFRAN has turned out satisfactory working result for 1978. Production of all specialities and chemicals was satisfactory. Net sales increased by 18.1 per cent, from Rs 5.5 crores to Rs 6.5 crores. Gross profit advanced by 36.6 per cent form Rs 71 lakhs to Rs 97 lakhs. Net profit is Rs 35 lakhs (Rs 20 lakhs), which

covers the dividend stepped up 4 points to 16 per cent 1.8 times. The plant for the manufacture of collaborators research product, isoxsuprine hydrochloride, was installed and trial runs undertaken thereon. Commercial production is expected to commence soon. The company is awaiting industrial licences for anti-histaminic and anti-rheumatic drugs. The management is assessing the impact of new Drugs (Prices Control) Order, 1979, on the company's profitability. With increase in excise duty on cosmetics, from 63 per cent to 100 per cent, the company anticipates some consumer resistance to the consequent increase in prices. A three-year agreement with the staff union has been signed in March last.

ESCORTS proposes to set up a joint venture in India in technical and financial collaboration with Maschinenfabrik Augsburg Nurnberg (MAN) of West Germany for manufacture and marketing of high-speed diesel engines of 100-650 horse power. The capital cost of the project is estimated at Rs 13 crores. A new company, 'Escorts MAN', is proposed to be incorporated to take up the project. Initial subscribed and paid-up capital will be about Rs 3 crores. Escorts proposes to subscribe upto Rs 2 crores and MAN Rs one crore. Demand for high speed diesel engines in HP range 100-650 for stationery and automotive applications is on the increase with prospects likely to improve for marine applications. Escorts has also promoted a joint venture with J C Bamford Excavators of UK with a view to supplementing the industrial equipment range for manufacture of 75 HP excavator-loaders with capacities of front end loader upto 1.2 cubic metres and backhoe 0.3 cubic metre. The licensed capacity applied for is 500 units with 25 per cent export commitment. The project has a gestation period of less than a year and, commencing with at least 50 per cent indigenous content and 80 machines a year, it is expected to achieve full licensed capability in three years. The manufacturing operations of the venture, styled as 'Escorts JCB', in which Escorts will hold 60 per cent share capital and JCB 40 per cent, will be located at Ballabgarh near Faridabad. Distribution of products will be assigned to Escorts. Escorts has also entered into technical collaboration with YAMAHA of Japan. This will bring to India for the first time a 2-stroke, 2-cylinder motorcycle engine of 350 cc, developing an output of 18 to 24 HP. This technology will be integrated into the expansion and diversification plans of motorcycle production, maintaining the existing 'Rajdoot' range. Production based on Yamaha technology is expected to commence by mid-1981. The management has also approved a five-year capital investment programme to increase production, subject to the approval of the government, by 50 to 100 per cent for different products, such as tractors, motorcycles, automobile ancillaries, etc.

NEW GREAT EASTERN SPINNING AND WEAVING has turned out poor results for 1978 due to, according to management, 'illegal' strikes, labour unrest and continuous go-slow by workmen. Net sales were only a shade lower at Rs 17.24 crores against Rs 17.52 crores in the previous year, but gross profit was a fourth lower at Rs 63 lakhs (Rs 84 lakhs). Net profit was halved at Rs 23 lakhs (Rs 46 lakhs). The only consolation for the shareholders is that dividend is maintained at 12 per cent which is covered 1.25 times. Export sales fell sharply from Rs 11.77 crores in the preceding year to Rs 2.74 crores in 1978. Having received the consent of the Controller of Capital Issues for augmenting equity capital by Rs 70 lakhs, offer letters have been issued to the shareholders for this purpose. The company spent about Rs 66 lakhs on modernisation of plant and machinery during the year. The company's overseas venture, P T Horizon Syntex of Indonesia, in which the company holds 10 per cent interest, is working well and expects to achieve profitability in a couple of years. During the current year there have been minor setbacks among other reasons owing to load shedding and power cut.

HERDILLIA CHEMICALS has applied to the government for substantial expansion of its phenol capacity from 15,240 tonnes to 33,240 tonnes per annum. This project is estimated to cost Rs 25 crores. Meanwhile, the renovation and modernisation programme in respect of the cumene/phenol facilities is in progress. The company's application for doubling capacity of phthalic anhydride plant is still under consideration of the government. The licence for recovery of by-products is expected to be cleared soon. The management believes that the company has a significant role to play in the petrochemical industry and see good potential in the associated and free gas from the Bombay High and Bassein fields, which is currently being fuelled The management is keenly awaiting the government decisions in regard to location of gas crackers, pricing of the basic streams and ownership patterns for downstream activities so that it can plan its participation in the future petrochemical plans. The chairman, R Venkataswamy Naidu, feels that in formulating the policy the maximum possible emphasis must be placed on the utilisation of existing investments, as the economic benefits of the expansion of existing units have been recognised in almost all the working group reports on the growth plan for the chemical industry.

Alembic

Alembic Chemical Works Company Limited

Speech of Shri R. B. Amin, Chairman, Board of Directors, at the 72nd Annual General Meeting of the Company, held at Baroda on Thursday, 14th June, 1979.

Ladies and Gentlemen,

I have pleasure in welcoming you all to the 72nd Annual General Meeting of the Company. The accounts for the year ending 31st December, 1978, have been forwarded to you in advance and, with your permission, I shall take them as read.

The total sales of your Company advanced by 15.8 per cent during the year, from Rs. 28.81 crores in 1977 to Rs. 33.36 crores in 1978. Production levels in basic drugs as well as formulations were maintained and improved upon. However, the increases in production and sales could not reflect themselves in the working results of the Company because the costs of inputs increased sharply and prices of drugs as fixed by the Government did not take due account of these increases. The electricity tariff and the price of natural gas fuel were raised sharply during the year. These together meant an increase in costs to the extent of Rs. 16.30 lakhs. Energy is supplied by government monopolies and they can and do increase their tariffs abruptly and exorbitantly. Our industry, however, has its prices fixed by the Government and upward revision is a slow process, and the norms fixed also do not include many factors which push up costs. Prices of some formulations were frozen during this time. In Glycodin one of our major products, the price of codeine, which is supplied to us by the Government, was increased by more than 50 per cent. But no increase of price was allowed and it has not been ratified till today. Our already narrow margins were wiped out in this and such other formulations, and we operated at a loss. Packing materials, because of the rise in all variety of paper and boards, cost Rs. 28.32 lakhs more than that in the previous year. In raw materials, prices of cocoa rose sharply, so did that of sugar. All this had its inevitable effect on the working results of your Company and adversely affected its profitability.

The revised price control order under the new drug policy has now been issued. The basic requirement for fair and equitable price regulation is that the price control order and its implementation should, from the start, promptly and realistically allow for increases in the costs of inputs. The process for these adjustments in price still remains time-consuming and negative and proves a massive disincentive for continuing with production, leave alone desiring to expand or diversify it. As presently implemented, the industry is forced to bring their product prices down in line with the leader prices. Industry should have been allowed to simultaneously raise their prices which are lower than leader prices. At the same time, all the price revision applications which are frozen for the past year and new ones consequent to the revised norms should be disposed of within one month.

The new Order means a squeeze on producers which can only make production unprofitable and damage their capacity to further produce and market drugs. The projected growth during the Sixth Plan envisages an output of Rs. 625 crores of bulk drugs and Rs. 1900 crores of formulations per annum. This entails a minimum investment of Rs. 370 crores for bulk drugs and Rs. 265 crores for formulations. As of now, the viability of the industry is so badly affected that efforts of this Order in terms of investment, new production as also research and development are just not possible to materialise. Freedom to produce and to compete will automatically check prices at proper levels as it did in the past when there was no price control. We only hope that the Government will see the realities of the situation and set things free instead of the present efforts which can only cripple the pharmaceutical industry, leading to a short supply of drugs and thereby jeopardise the health requirements of our people.

Your Company, in the expectation that Government will act promptly and fairly, would, as in the past, prefer to go ahead with diversification and expansion. We would also like to maintain this forward-looking stance and our usual preference for giving weightage and importance to the manufacture of basic drugs in our overall plans for production. We are also unable to understand why the declared policy of the Government regarding the proportion of bulk drugs and formulations as 1:10 has not been implemented. It is only fair that a Company like yours, should be able, without formalities and delays of procedure, to expand its range and output of formulations to the extent of ten times its own output of basic drugs. Release of raw materials also should be automatic and substantial if our country is to avoid shortage in drugs, which are being experienced from time to time even now. Steps to restore the strength and vitality of the drugs industry have to be taken now; otherwise shortages will be the inevitable consequence.

Before concluding my Statement, I record my appreciation for the efforts put in by the workers, the staff and the managers of your Company during the past year. I also thank my colleagues on the Board of Directors for their counsel and co-operation.

I now commend the Annual Accounts and the Directors' Report for your consideration.

Note This does not purport to be a record of the proceedings of the Annual General Meeting.

NEW DELHI

New Perspective on Energy Policy

B M

SOME anxious rethinking on overall energy policy and perspective has been induced by what is called the second oil crisis hitting the country and the world economy as a whole. The working group on energy policy set up under the auspices of the Planning Commission is expected to submit its report in a few weeks. It is indicated that the report will present far reaching propositions for the planners and policy-makers to consider. What is being emphasised is that conventional parameters which have so far governed thinking on energy policy will have to be given up and some structural reforms in this sector will have to be boldly faced.

It is being argued in this context that so far as oil is concerned, the question is not just one of its high price which should be expected to be increased still further. The question which must now be faced is that of adequacy of supply of oil. There is no longer any option but to plan on the basis of very small additions to oil availability, quite apart from the problem of its rising price. This idea was forcefully presented also by the Fuel Policy Committee headed by S Chakravartty, a former member of the Planning Commission, immediately after the first oil crisis in 1974. But the policy response to the Committee's report was only to apply the fiscal instrument to discourage the consumption of some petroleum products and incidentally also to collect some revenue for the government through a steep hike in excise duties on petroleum products. The government, it is now suggested, has gone in this direction to a point where the efficacy of the fiscal instrument itself has been blunted. This is evident from the fact that in spite of stiff excise levies consumption of petroleum products has kept on rising and the rate of increase is currently higher than even what was recorded during the era of cheap oil. This only underlines consumer preference for this versatile and valuable source of energy. But since availability in adequate quantities to meet rising demand is itself in doubt, the trends in consumption of oil will have to be halted and not only by further increases in excise on its consumption.

This analysis would appear to have implications for policy-making. So far as the Finance Ministry is concerned, its present worry is the possibility of a further increase of oil prices by the OPEC countries. The increases already effected during this year are calculated to have added Rs 900 crores to the import bill for crude oil and products and the total oil import bill in 1979-80 will run up to as much as Rs 2,700 crores. If there is a further increase in price, the position will become difficult and the burden on foreign exchange resources will be quite severe. Even so, however, an increase of 4 per cent in import of crude and products is planned for the current year. The Finance Ministry will, therefore, welcome some additional restrictions on the rising trend of consumption. At the same time, however, the revenue from consumption of petroleum products has become a major component of budgetary resources and the Ministry will not like to forgo any part of this revenue; on the contrary, it counts on this source for filling some of the budgetary gap and this presupposes a steady increase in consumption at rising price levels for the consumer. It is, therefore, busy making a case for what it calls "adjustments upwards" in consumer price in the event of any further increase in the import price of oil and its products, including fertilisers. It is not likely, however, that a substantial increase in fertiliser prices will be permitted on political grounds, specially with Charan Singh heading the Finance Ministry. The axe will, therefore, fall on other petroleum products. As against this approach of the Finance Ministry, the working group on energy and the Planning Commission are expected to recommend measures to curb further increases in consumption of crude and petroleum products which will go beyond tinkering with their prices, and the excise levies on them.

Where the latest study of the energy problem by the Planning Commission's study group marks a significant break with earlier studies, and in particular the report of the Chakravartty committee, is in respect of the role of coal. The Chakravartty committee, under the overwhelming impact of the oil crisis had, it is now argued, plumped for a comparatively soft path when it opted for coal as the substitute for oil and recommended that coal should be adopted as the principal energy base for the national economy and its future development. But it is now being contended that this was a rather hurried and short-term view of the energy problem. Coal may be regarded as an energy source in abundance, but it is not unlimited and, in addition, poses difficult problems of economic extraction and efficient utilisation. A switch to coal as the alternative to costly imports of oil is not an adequate answer to our problems, according to the thinking of the energy working group.

The energy working group has drawn attention to another sensitive problem in the energy sector. According to its calculations, the use of energy sources in India is far too wasteful and inefficient at present. A one per cent increase in GDP, it has calculated, requires input of energy of the order of 1.9 per cent. This too is dependent on an energy mix in which oil forms one-third of all forms of the commercial energy consumed. If the share of oil goes down, the efficiency factor will become even more adverse. So far as electric power is concerned, the position is that the ratio rises to 2.9 per cent injection of power for one per cent increase in GDP. This calls for a close look at two basic aspects of the energy problem. One is that our development process is far too energy-intensive and this pattern is simply not sustainable. It is necessary, therefore, to make suitable modifications in the development strategy itself. It is, of course, not quite clear what exactly are the implications of this proposition unless, of course, it is meant to suggest that rapid industrialisation, especially development of basic and heavy industry, should be avoided. The other idea, and it is being canvassed in some quarters, is that that energy-intensive agricultural development will have to be slowed down.

But it would appear that the principal thrust of the working group on energy is to make more efficient use

of energy resources to get optimal results in development. Here the stress is on standardisation and improvement of efficiency of machines and equipment. This is an area of great potential, it is pointed out. An instance cited in this connection is pump sets which number at present as many as 3.5 million servicing agricultural requirements alone. Many of these pump sets, it is pointed out, have a fuel efficiency factor as low as 10 per cent and there is a great deal of waste of fuel and energy on that account. This is also true of many other areas, especially in the transport sector, in particular railway traction.

The principal recommendation of the working group, however, is that not so much a switch to coal as reliance on hydro power and nuclear energy will be the most effective answer to the problem of energy in our situation in the long run. It is admitted that in the short and medium term there is no option but to restrict the use of oil while depending on coal for fuel and for generation of power. But the policy perspective must shift in favour of hydro and nuclear power. Since the development of hydro and nuclear power involves long gestation periods, action in this direction must be initiated right now. This should be combined with better use of bio gas resources, forest wastes and wood.

Meanwhile as matters stand and because of the lags in development of power since the Plan holiday in the mid-sixties, the power problem will have to be put up with for a long time and there is no solution to the power crisis in large parts and areas of the country. The only solace is that the neglect of the power sector in planning and investment policies which was marked in the last ten years has given way to a better appreciation of the need for rapid development of this critical infrastructure for development and some energetic action in this direction has also been initiated since last year. The eastern part of the country is still a bad patch in the power picture and the western part is also facing many difficulties and it will take some time to improve the position in these two regions. But the position in the north and south is said to be relatively comfortable.

PUNJAB

Victims of Green Revolution

Amarjit Chandan

EVERY year, when wheat-harvesting season is on its peak in Punjab, many agricultural labourers, mostly harijans, lose their limbs in thresher machine accidents. Some die of excessive bleeding and others of tetanus. The number of such accidents has gone up to 500 in Punjab and almost to 5,000 throughout the country.

Farm machinery started appearing on the Punjab agricultural landscape in the early 1960s and gradually the traditional system of threshing became obsolete. Unauthorised and untrained blacksmiths started manufacturing threshers in small towns and villages on a large scale. The power/engine-run thresher costs Rs 3,500 each with power-motor costing extra. Earlier. Moga and Ludhiana were two main manufacturing centres of farm machinery. According to Punjab Agricultural University, there are now about 1,70,000 threshers in 12,000 villages of Punjab.

The Harvesting, Threshing and Transport Equipment Committee of the Indian Standard Institute (ISI) has laid down three standards for safety in threshers; but by not conforming to these standards (merely to save on a bit of iron sheet), the unauthorised and untrained manufacturers have been playing with the lives of hundreds of farm labourers. The feeding windows of threshers are left uncovered. Only ten per cent of the total threshers in Punjab come up to the ISI standards. The second important factor contributing to these injuries is the practice of overtime employment of farm labourers by the rich Jat Sikh farmers. To extract the maximum possible labour from them, these rich farmers give them opium, hemp, pep pills and liquor free of charge. The weak-sighted labourers under the influence of liquor and other drugs work day and night in scorching heat (at night under insufficient light) and get completely exhausted. Naturally, their senses and responses are dulled and they become victims of the machine which sucks their arms and chops them to bits and shreds. The profusely bleeding labourers are taken to hospitals only to get their limbs amputated and to become handicapped for the rest of their lives.

This year, in Sangrur district, by mid-May the accident toll had risen to 14. It included a 20-year-old girl and an 11-year-old boy. Nine labourers lost one arm each, three lost one leg each and two labourers lost both their hands. In Mukatsar tehsil of Faridkot district, the accident toll was 16, which included a boy of 14 and an old man of 70. The Miss Brown Memorial Hospital at Ludhiana treates two or three such cases everyday.

In Faridkot district the wages of labourers working on threshers are Rs 10 per day and they do not get any extra wages for working in the night shift. In Jullundur district, the purabia labourers are paid Rs 10 for the day and Rs 12 for night shift along with meals, as they do not accept wages in kind. The local labourers get wages in kind; 2.5 kg wheat for every 40 kg wheat threshed (it is assumed that a 40 kg unit is equivalent to the obsolete maund of 40 seers). The rich farmers also hire out tractors and threshers to small farmers who cannot afford to buy threshers and receive rent in kind — one sack for every ten sacks of wheat. A sack weighs one quintal of wheat. In almost all the districts the combine-harvesters have been introduced by the state-run Markfed and private agencies. The harvesters are booked in advance and the charges for harvesting an acre is Rs 250. Obviously only the bigger land-holders can afford combine-harvesters; and in spite of the harvesters there is no surplus labour, because of large scale migration of Punjabi labourers to the Gulf countries.

The wages for harvesting vary from region to region according to the quality of the crop and availability of labour. In Jullundur district the wage in kind ratio varies from 1.12 to 1.20 bushels or 60 kg to 90 kg wheat. The purabias get Rs 85 to Rs 100 per acre.

The Punjab government has set aside Rs 20 lakhs for thresher victims in the current financial year, says the state's Public Relations and Religious Affairs minister. Only god or bureaucrats know where this huge sum of money would go. Meanwhile the General Insurance Corporation is said to be seriously considering a Village Accident Scheme.

COAL

Threat of Man-Made Floods

THE coal mines in the eastern region are now facing a new type of problem — man-made floods. They are not getting enough power to pump out the water from the underground pits. The problem has been there for quite some time, but it threatens to assume alarming dimensions with the monsoon knocking at the door. Unless the power supply to the mines improves, at least some of the more vulnerable mines may get flooded and be thrown out of commission for weeks, if not months.

Two important functions for which coal mines require power are: pumping out water from the underground pits and ventilation. On a rough estimate, about 75 per cent of the power consumption of a mine goes for these vital operations, while the balance is used for other purposes like moving the lifts and lighting. Dewatering and ventilation become more important, and also more difficult, in the monsoon months when the air turns more heavy and the water accumulates faster.

The mines under Eastern Coalfields Ltd and Bharat Coking Coal Ltd require about 250MW of power for their different operations. The supplies are supposed to come from Damodar Valley Corporation. But for some time, DVC has not been able to meet the full demand, largely because of the dip in its own generation. The shortfall, according to CIL sources, would come to anything between 80 and 100 MW a day.

With the monsoon round the corner, the situation has taken an alarming turn. And CIL is now frantically looking for additional power supplies, for the mines must have enough power to pump out the water. It expects — as much as does DVC — that the DVC's own generation and supplies would improve in the coming months. But it is not leaving anything to chance and is trying to tie up arrangements for the difficult days ahead.

An agreement with the Uttar Pradesh State Electricity Board for supplying 60 MW of power during the night hours — between 10 pm and 6 am — has been finalised. The supplies would flow through the Bihar State Electricity Board system into the DVC grid. Deducting transmission loss, etc, 50 to 55 MW of additional power would be made available to the coal mines.

Coal India authorities are also eyeing with interest the power situation in the eastern coastal states, especially Orissa. With the monsoon round the corner, Orissa is likely to switch on an additional 62.5 MW unit at its Talcher hydel power station. In that case, another 50 MW might be wheeled into the DVC system for transmission to the coal mines.

Last year, a large number of coal mines were innundated in the devastating September-October floods and it took several months to set things right. But if a similar situation develops just because the mines could not perform their elementary pumping operations, it would be more than a disaster — it would be a crime.

It is all a kind of vicious spiral. Power shortage effects coal production and lower coal production in turn affects electricity generation. At the moment, the spiral is steadily moving downward. And, conceptually, a time might come when the process would be put in the reverse gear — more coal, more power and in turn still more coal, and so on. But when that big day would come is now anybody's guess.

The steel plants, the power stations, industrial units — b g and small — all have been making noises about coal shortage. For some, the problem is of quantity, for some others it is of quality while for a few it is both. And all this is happening when as much as 13 million tonnes of coal were supposed to be lying at the pitheads, open to the danger of catching fire at any time during the long hot summer.

The essential precondition of black marketing — shortage — is apparently not present, though of course there is certainly not enogh good quality coal to meet all the demand. But the blackmarketing that is now steadily growing is not limited to good quality coal only. A small businessman in Calcutta running a small oilseeds crushing unit thus buys a lorry-load of coal at a high premium with a delivery order issued in the name of a party, perhaps non-existent, in Bihar. And this is not a solitary instance.

Informed official sources themselves are saying that in some hotels in Ranchi and Asansol regions, DOs (delivery orders) are being sold under the counter at high premiums. It is ever apprehended that the more enterprising ones of the trade have gone to the extent of printing the DO forms on their own and doing business with them with, of course, official connivance. One of the answers lies in asking the Nasik security press to print the DOs!

Another lies in doing away with the elaborate paraphernalia which has to be meticulously gone through for purchasing coal. An industrial buyer has to have his purchase plan sponsored by a competent state government official in the district or city then get it endorsed by various other agencies. For a small party, the process may drag on over a couple of weeks; for the more influential one, it may take a shorter time.

There is thus much to be said in favour of the suggestion mooted in industry circles that the sale of steam or non-coking coal should be made free. In other words, the rules should be cut drastically and any industrial unit interested in buying coal should be allowed to do so without much of a formality straight "off the shelf". Non-coking coal is now said to be in abundant supply; in fact, the carryover stocks are posing a financial burden for the producing companies. A depletion of the stocks should thus be welcome.

The fate of this suggestion is not known, but the chances are that powerful vested interests which want the continuation of a system that helps them line their pockets would not easily agree to, such an idea. But a surplus position like the one we are having at present should act as a damper to any move to corner stocks or create an artificial shortage. Sometime after the monsoon is over, the authorities may still choose to make a go.

As for coking coal, the situation is however entirely different, for it is very much in short supply. The users of imported coal — the public sector steel plants — are known to be extremely happy with its performance, but, allegedly, part of the low-ash coal is being pushed into the coke ovens without being blended with domestic coal, as was originally planned. This is posing a danger to

machines which are not designed to take the tremendously high calorific value of the imported stuff. Interestingly, some of the leading private sector companies are known to be itching for an opportunity to use the imported coal, if needed, by even diverting the supplies!

RELIGION

Price of Devotion at Tirupathi

Bhaskara Venugopal

TILL about 10th century, the Tirumala temple was not considered particularly important or holy. At the beginning of the 10th century, when Saivaite influence gained prominence, Sri Vaishnava leaders were forced to seek some place where there was no room for sectarian controversy. The Tirumala temple, where no settled form of worship had been established till then, was thus chosen by Sri Vaishnava leaders. A silver image of the Lord was duly consecrated (in 966) and subsequently the high ideals of Nammalvar put into practice contributed to the growth in the popularity of the temple. The temple enjoyed considerable prosperity, especially under the Vijayanagara kings.

During this period and until the 15th century, worship in Tirumala temple was free to every person and no fee was ever demanded. In fact "the aim was to provide food and shelter free to all pilgrims".

When the South began experiencing the invasions of the Muslim iconoclasts, there was the need to protect the temple from plunder and destruction. This was achieved, interestingly, both by the topography of the country and the hills as well as the sagacity and ready wit of the people of Tirupathi and those who managed the temple. Comprehending the psychology of the alien invaders, the managers of the temple dangled before them the prospect of a recurring revenue from the temple. The invaders in turn realised that it was better "not to cut the udder that yielded an unfailing supply of milk".

The 18th century and early 19th century witnessed games of one-upmanship among the various rulers to appropriate the temple revenues. When, after the British conquest of the Carnatic and the assignment of the revenues of Tirumala temple to them, a Muslim adventurer tried to attack Tirupathi in 1753, the British government in Madras, "alarmed at the prospect of their losing the revenues from Tirupathi", captured the Muslim and executed him. Around 1757-58 another interesting event occurred. One Nazibulla visited the fort of Salava, and threatened to take away the offerings made by pilgrims, during the next *Brahmotsavam*. The British immediately sent forces to check him. In 1758, a brother of the Nawab, Abdul Wahab, made a bid for the wealth of the temple. The British foiled this attempt too.

From about 1724 till 1801, when finally the direct management of temple passed into the hands of English, some renters had controlled the affairs of the temple. To prevent the alien rulers from stepping upon the hills and attacking the temple these renters agreed to pay an amount of Rs 2 lakhs per annum to whoever it was that ruled over the region, and such protection money was paid successively to Muslim, French and British rulers.

A scheme had to be devised to rake up this much amount year after year. Thus it was that "a levy was made on the pilgrims who resorted to the temple". Custom dictated that certain Sanskrit verses should be recited while the pilgrim bathed in the temple pond. The priests dictated the verses for him and the right to such dictation was leased out — for a fee. The lessee in turn collected money from pilgrims for reciting the verses. Likewise, a fee was collected for tonsure, for lighting the camphor, and for attending the *archana*. Also, when a presentation was made to the deity in kind, a cash equivalent to the value of the article was also to be paid. So was it with food offerings.

To attract pilgrims, new legends were manufactured. More holy bathing ponds (*tirthams*) were discovered and added to the existing list of sacred waters on the hills Among such bogus places of sanctity is a round stone known as "Kshetra Pala" near the Gogarbham Tirtham. To settle disputes among people, oath was administered at this place before lighted camphor and a fee had to be paid for this service. According to T K T Viraraghavachari, there is not a scrap of evidence, direct or inferential, in all published inscriptions to show that at any time before the temple passed into the hands of alien rulers "there was any levy of fees for offering worship in the manner a pilgrim desired to do". In other words, "an iniquitous system for which there was neither traditional, sastraic or moral sanction, was sedulously cultivated which benefited the renter, the Nawab and perhaps a few of the temple functionaries".[1]

In 1801, the British inherited this system in full from the Nawabs and subsequently passed it on in 1843 to "a still more hungry Mahant". "When the Mahants were cleared out and the TTD committee stepped in, the iniquitous system was continued as before, *nay the rates were revised to bring in* more revenue." During the days of the Mahants' management, another preposterous legend was coined. It was propagated that the god played a game of dice with one Nattiram Bavaji, placing the temple and even himself at stake, lost, and handed over the temple and all it contained to one of Nattiramji's disciples.

Quite appropriately, it is Lord Clive, 'founder of the British dominion in India', to whom credit should go for initiating the practice of special treatment to VIPs at Tirumala temple. In a 'recommendation letter' he instructed the temple authorities (then under the control of the Nawab of Arcot) to afford all conveniences to one Rajah Raghottama Rao who had experienced 'difficulties' in offering worship and had made a discreet mention of the fact in his thanksgiving message to Clive.

That was way back in 1740s; more than 200 years later Viraraghavachari was bemoaning the fact that, "all the factors which contributed to the growth of such difficulties still exist... As evils invariably take deeper root even after the causes which bred them originally are removed, the levy of fees for worship still continues in the name of the good administration of religious institutions".[1]

The TTD authorities obviously had no grounds to delete these sentences even from the Second Edition of the book, brought out by themselves in 1977.

Note

1 T K T Viraraghavachari, "History of Tirupathi, Volume I", Tirumala Tirupathi Devasthanam Publication, Second Edition, 1977, p 19. All the citations in the article are from this book.

Keeping the Home Fires Burning

S V

ON June 2, 1979, about 150 demonstrators carrying placards, 'Women are not for burning', 'Nariyon dahej ka shikar mut bano', and shouting slogans, 'Jo samaj nari ko jalata hai, Woh samaj badalna hai', took out a protest march in Model Town, Delhi. The protest march ended at the upper middle-class house of Satpal Singh Anand, whose wife Tarvinder Kaur had been burnt to death on May 17. In her dying statement, 24-year old Tarvinder, married only five months earlier, had stated that her mother-in-law and sister-in-law had poured kerosene on her and set her afire. According to Tarvinder's father, her in-laws were pressing for Rs 10,000 for the expansion of their motor spare parts business. While the protesters shouted, 'Boycott the Anand Family', and 'Punish the killers of Tarvinder Kaur', inside an old uncle of the in-laws family sat chanting the 'paath' for the burnt daughter-in-law. The demonstration was organised by a newly formed group of women activists, 'Stree Sangarsh', and was followed by a similar demonstration on June 12, this time at the Boat Club, organised by another women's group 'Naari Raksha'.

The issue is literally a burning problem. 200 cases of women being burnt to death have been reported in 1978 in Delhi alone — allegedly due to a stove accident, or a sari, usually nylon, catching fire, or suicide. Women are victims of 75 per cent of all burn cases in Safdarjung Hospital. Apart from the fact that many cases go unreported, not much happens in those that are registered with the police. Only 9 of the cases registered in 1978 could be investigated and substantiated. This is due to several factors: reluctance of neighbours to testify, corruption at police and judicial levels (allegations are rampant on this score), and the use of kerosene for burning the victim which leaves little or no evidence behind. The primary factor, however, is public indifference, the attitude that 'such things happen' (remarriages have taken place shortly after the wife's 'suicide' or 'accident') and the social norms that dictate that once married, a woman must make her home with husband and in-laws notwithstanding harassment, beating, even torture. In one instance, the in-laws brutally starved and beat the one-year married bride demanding Rs 50,000 and two trucks. Although the family brought back their daughter, they are not lodging a complaint with the police lest it spoil chances of future reconciliation. "It will be a stain on the family", they say, if their married daughter stayed permanently in the paternal home.

Most of the burning cases involve victims from the age group 25-30, coming from lower to upper middle class families, and are related either to 'insufficient' dowry brought at the time of the marriage or to subsequent demands for cash, TV, scooter, air-fare for foreign travel and the like. The problem is not confined to the Hindu community; incidents of wife-burning among the Sikh and Muslim communities as well have been reported. Families who want to or have registered cases that their daughter has been murdered are known to have been harassed and intimidated by the in-laws. The mother of one victim has alleged that the in-laws have threatened to kidnap her younger daughter should the family press the case in court. The mother, frightened by this threat, wants to stop the education of her younger daughter who is at present studying at a women's college in the campus.

In the wake of the demonstration by Stree Sangarsh, there are proposals afoot to put more teeth in the Prohibition of Dowry Act (1961) which till now has virtually remained on paper. An amended bill is to be brought forward in the next session of parliament making the offer and taking of dowry a cognisable offence, increasing the punishment, and putting checks on ostentatious display of gifts. These measures, however, will not result in much, they will only drive underground the giving and taking of dowry.

The ICSSR is to undertake a detailed investigation into the alleged murders and the extent to which this social evil prevails. Studies so far have indicated that the problem is most acute in Punjab, Haryana and Delhi and in the Saurashtra region of Gujarat. Cases of wife-burning, however, have also been reported in Maharashtra and Kashmir. The Report of the Committee on the Status of Women in India (1971-74) states that the practice of dowry is [illegible] and lower-caste groups which earlier practised bride-price are starting to adopt the custom of dowry, and the practice is now catching on from the urban to the rural areas. The change from bride-price (payment made to the father in exchange for authority over the woman and as implicit compensation for the loss of a productive family worker) is a move to improve the status of the family at the expense of the daughter's status in the family where she becomes a liability instead of an asset. In the opinion of the report, "This is undoubtedly a consequence of the withdrawal of women from productive activities and of the loss of productive skills".

Investigative studies and legislation are both needed, but what is needed even more is that women develop their own organisations to spearhead the struggle for change in their condition. Some established women's organisations do exist, both autonomous and those linked with political parties. They have not as yet been dynamic enough; their activities have been mostly confined to seminars, conferences, a few demonstrations. New groups have recently emerged in Delhi; the activists generally belong to the educated middle and upper classes: students, teachers, social workers, housewives. Whether they will be able to consolidate themselves and develop into mass organisations remains to be seen. But unless the older and new organisations are able to effectively launch struggles on women's issues, women like Tarvinder will continue to be victims of the social and economic conditions in our country.

Britain 1979

Britain 1979 — An Official Handbook, published in London by Her Majesty's Stationery Office, contains factual information on almost every aspect of British national affairs. Prepared and revised each year by the Central Office of Information with the co-operation of Government departments and many national organisations, it is designed to answer the questions about Britain that are most frequently asked in overseas countries. The 1979 edition has 500 pages and is illustrated by photographs, diagrams and maps. Each chapter has a short bibliography giving sources and further titles for reference.

"Britain 1979" costs Rs 123.20 and copies may be obtained from the Sales Section, Information Department, British High Commission, Chanakyapuri, New Delhi 110 021.

MAHARASHTRA

Waiting for Final Round

THE recent elections to the co-operative institutions in Maharashtra have created a kind of a political impasse. The state's powerful co-operative lobby, which so far used to stand solidly behind the Congress party, is now divided in different groups each one supporting a faction of its own choice. This situation has given rise to a formidable tussle for occupying positions of power on the apex co-operative bodies.

In a state like Maharashtra, where co-operative institutions wield a considerable influence over the rural economy, solid support of the co-operatives is a powerful weapon in the armouries of the politicians. When one really understands this secret, the inadequacy of the Janata party in spite of its numerical superiority in the state legislature can be easily explained. It was for this reason that the leaders of the Janata party shrewdly relied on the parallel Congress of Sharad Pawar to form a coalition government in the state. They knew that without the backing of at least a section of the co-operative force, any government in the state would be ineffective.

That Sharad Pawar has proved to be far more astute politically is another matter. He knows why the Janata is pampering him. He has not only not allowed the Janata to exploit his rural influence, but has instead used the Janata backing to extend his own influence in the co-operative and rural lobby. Pawar has to be really grateful to the Janata party because now with the help of power and that party's support he has thrown a serious challenge to Vasantrao Patil, the former chief minister and so far the undisputed leader of the co-operative lobby.

Indeed, Sharad Pawar has been so realistic in his political assessment that he has almost ignored with contempt some half-hearted challenges from the Janata ranks and has concentrated most of his energy and manoeuvring on the co-operative front. The Janata party, with practically no co-operative support, was to him a far less dangerous enemy than Vasantrao Patil with the enormous co-operative power at his command, although Pawar commanded little influence in the assembly as compared to the Janata.

Hence the first task Pawar addressed himself to was to attack and destroy the co-operative power of Vasantrao Patil. And attack he did with all the vehemence and resources and with the characteristic astuteness which he inherited from his well-known political guru, Y B Chavan. Right from primary credit societies to district co-operative banks, sale-purchase societies, marketing committees, co-operative sugar factories and the apex bodies, Pawar's faction fought aggressively. The smuggle was not easy for Vasantrao Patil who has been the supreme leader of the co-operative lobby and possesses vast knowledge of working of the co-operative movement.

Pawar's attack, however, did take its toll. A number of Patil's followers steered their white caps into Pawar's camp. A few of his group's co-operative sugar factories too were lost to Pawar. But Patil has tenaciously kept his hold and refused to yield. Nearly half of the fifty and odd working co-operative sugar factories are under the command of his group while the rest belong either to Pawar's group or to ex-Congressmen in the Janata camp.

And yet Patil managed to get elected his own follower as the chairman of the apex body of the co-operative sugar factory. The Maharashtra Rajya Sahakari Sakhar Karkhana Sangh. Similarly, the chairmanship of another powerful body, the state co-operative marketing federation, also went to his trusted follower.

But the most important co-operative office is that of the chairman of the Maharashtra Sate Co-operative Bank which practically controls most of the co-operative finance in the state. The apex bank, which has a working capital of more than Rs 400 crores, is considered to be more powerful than the state's co-operative department. The chairman, with enormous powers to sanction credit and loans, can hold the entire co-operative lobby, including the district banks and the co-operative sugar factories, in his grip.

Thus the elections of the chairman of the apex bank in Maharashtra always had political overtones. This time, Patil himself is said to be in the field and Pawar is still in search of a suitable candidate who could give a fight to the formidable co-operative leader.

The election of the chairman was actually due in March this year. But it has been postponed more than once. The new board of directors has long been elected but it has not held a single meeting as yet for in the very first meeting the board has to elect its chairman. The new board's meeting was scheduled for May 2 but was subsequently postponed, presumably because of the government's intervention on the ground that the election of one of the district co-operative banks was yet to be held.

However, the implications were clear in the co-operative circles; Pawar's group did not want the chairman to be elected before the zilla parishad elections were over. The election is now due by this month end and it is to be seen who really controls the crucial body and in effect the entire co-operative network.

For Pawar, it is politically important to have a firm grip on the co-operative lobby. In Maharashtra, it is not enough to hold power at the state level. Political power is not consummated unless one tightly holds the co-operative strings in one's hand.

While these battles go on, one wonders whether any serious thought is being given to the damage done to the spirit of the co-operative movement. In terms of credit, working capital, number of primary societies and processing industries, Maharashtra's co-operatives come ahead of such co-operative movements in all the states, Gujarat being a poor second. However, because of increasing political overtones, Maharashtra's movement has suffered immensely in efficiency, and the movement in Gujarat is in comparison far more efficient, dynamic and result-oriented. While in Gujarat, a co-operative processing industry is run strictly on professional lines, in Maharashtra, a co-operative sugar factory is simply looked on as a feather in the cap of the local politician who can hope to make his entry one day into the state cabinet on the strength of his factory. Other considerations, such as sugarcane area, irrigation facilities required for the purpose, viability of the factory, are secondary. This has resulted in large scale sickness amongst the co-operative factories.

The co-operative societies too have been used as tools of politics. Thousands of primary credit societies are on the brink of disaster as collection

[illegible] on poll [illegible] produce [illegible] three years a large amount of accumulated arrears have not been recovered because of the parliamentary [illegible] assembly [illegible] in parishad elections. Such is the state of the co-operative movement in Maharashtra; on the surface, healthy, prosperous and moving forward, but at heart, sick.

BIHAR

In Traders' Clutches Again

A S·

THE state governments' forest policies have been notorious for being guided not by the needs of the local people but by the mercantile and profit motives of entrenched interests. Felling of one species of trees and planting another, collection of forest produce, and the formulation of programmes by the forest department, are done invariably in the interests of trade and industry — indigenous or foreign. The adivasis have always been the people of the forest lands. The forests, their products and produce, have always yielded them their food and supplementary earnings. The yield from agriculture is pitiably low — thanks again to various institutional factors. So the adivasis cannot survive without the forests; but even this resource has been increasingly grabbed by trade and industry with the connivance of forest officials.

Sahu Jain's paper mill at Dalmianagar buys 65,000 tonnes (45 per cent) of the total bamboo production in Bihar; the rest goes to the three big paper mills at Calcutta. About 50 per cent of the total production of 45,000 tonnes of sal seeds is used by a single firm, Kanchan Oil Industries, Orissa. All of the 4,000 tonnes of mango kernels collected in Chhotanagpur find customers among the drug firms of Japan, Italy, and Switzerland. Lac and shellac go largely for export. Bihar's policy aims to promote forest-based industrialisation within the tribal region. But it is no secret that in the tribal region such development will serve the interests of big industry and foreign trade, not of the adivasi population.

A major group of forest raw materials whose production is essential to big industry is non-edible oilseeds. The principal oilseeds are sal, mahua, kusum, and karanj. The annual availability of sal seeds is estimated to 45,000 tonnes (valued at Rs 3 crores), of mahua 10,000 tonnes (Rs 1.5 crores), karanj 10,000 tonnes (Rs 40 lakhs), and kusum 5,000 tonnes (Rs 37.5 lakhs). Production per year of these four key non-edible oilseeds is thus estimated at Rs 5-6.5 crores. They feed the soap industry, mainly the big soap maufacturers. The adivasi producers of the oilseeds sell their products in the local, rural markets at throw-away prices, so dire is their need. A handsome profit is reaped by the intermediary traders who use their skills to buy cheapest and sell at the highest possible prices the manufacturers will pay. The latter still find these oilseeds cheap raw material — and have been known in the bargain to advertise the employment they thus create for the adivasis!

In April 1978, the Bihar government decided to take over the trade in mahua, karanj and kusum oilseeds. Sal trade had already been nationalised in 1977. The government said it had two aims in mind: one, to eliminate the traders, and two, to promote industries using the oilseeds. According to the Forestries Minister, Lalit Oraon, the government would pay the producers Rs 1.50 per kg of mahua, whereas the private traders were paying Re 1-1.25. The corresponding prices for karanj and kusum were to be one rupee (75 paise) and Rs 1.25 (one rupee). The main intention of the government was thus supposed to be to help the adivasis get 'fair' prices for their produce.

After the take-over, the government entrusted purchase of oilseeds all over the state to the Bihar State Forest Development Corporation (SFDC). The SFDC, set up in 1975, does not have any machinery worth the name for the purpose. It was almost impossible for it to buy the produce and the take-over led to much dislocation and losses for the adivasi producers. The adivasis — petty producers and collectors who can sell only a few kg at a time in the weekly hat and buy small rations for a few days from such supplementary earnings — found their life becoming more difficult than ever.

At Simdega in Ranchi district, [illegible] tions. [illegible] tration in [illegible] anger burnt down the [illegible] residence of two forest rangers. The police fired on the crowd and killed one person. The Forestries Minister commented that the 'denationalisation' stir had been engineered by the traders. But this was not true; for what the adivasis were protesting against was the utter failure of the SFDC to purchase their forest produce. The adivasis also claimed that the government prices were lower than those paid earlier by private trade. This was corroborated by almost all the legislators of Chhotanagpur. Moreover, the karanj trees (wholly) and the mahua and kusum trees (partly) are grown on ryot land, not in forest areas. Therefore, the peasants are legally free to sell the product to anyone whereas the government was forcing them to sell it to the SFDC. This argument, vehemently put forward on the peasants' behalf by the traders, would not have held had the take-over been successful, for the adivasis would never like to fall back into the clutches of the traders once again.

It was thus a curious situation in which the grievances of the people came in handy for the traders. Nevertheless, despite the large-scale agitation and the police violence last August, government seemed determined not to undo the take-over. The people suffered worse starvation because of the failure of the SFDC to buy their produce. Then, suddenly in October, the government did away with the take-over without any prior public announcement.

Why the decision was suddenly reversed is most important. According to forest department reports, the forest minister, a Jana Sanghi, acted at the bidding of the oilseed traders who, after all, were losing turnover worth Rs 6 crores every year. The minister, of course, holds that it was pressure from the people and the MLAs of Chhotanagpur who opposed the take-over that was the decisive factor. But that is hardly convincing since the people could hardly have wanted to return into the grip of the same intermediaries whom the government had decided to eliminate — and could have, if it had built the necessary machinery to purchase at the promised prices. Following this logic, the revocation of the take-over has been done in the interest of the traders.

SALT

Changing Military Balance

(By a Special Correspondent)

BEFORE the last Vienna summit meeting (between Kennedy and Khrushchev) the American President had peremptorily ordered the Russians not to place any nuclear missiles in Cuba and to dismantle those already there. The Russians who were then just beginning to flex their muscles, backed off before the overwhelming nuclear superiority of the US. A few months before the present Vienna summit it was Brezhnev who ordered the Americans not to interfere in Iran. That is a measure of the change that has taken place in the world as the second Vienna summit meeting of the two superpowers is held.

At Vienna, Carter and Brezhnev are to sign SALT II. This is the fourth arms agreement between the two superpowers starting with the Partial Nuclear Test Ban Treaty in 1962. None of these agreements have in any way slowed down the arms race. While talking of detente, the Soviet Union has furiously expanded its arsenal by some six times in the last 15 years, while the US has doubled its. The two superpowers have moved far ahead of all other countries, including the erstwhile great colonial powers. The Soviet Union, with a smaller GNP than the US, spends more on arms than the US. While US defence spending accounts for 5.2 per cent of its GNP, Soviet defence spending is upto 20 per cent of GNP.

The arms race between the two superpowers is not, contrary to popular misconception, restricted to nuclear arms alone. In the field of conventional warfare the USSR has forged even further ahead than it has in nuclear weapons. Its arsenal of conventional weapons equals that of US and Western Europe taken together.

In the successive Strategic Arms Limitation Talks the two sides have played a game of hide and seek with each other. In SALT I both sides agreed not to develop the costly anti-ballistic missile systems. The US conceded an advantage to USSR in total throw weight (number and explosive strength of warheads that could be delivered), hoping to counter this by its larger number of warheads which could be independently targeted. The US with its advanced electronics was then well ahead in the field of MIRV (multiple independently targetable re-entry vehicles) technology. In the intervening years the Soviet Union has developed and deployed its own MIRV systems. Newer weapons have also been developed in the years since SALT I. The Soviet Union has developed the 'Backfire' bomber which has intercontinental capacity. With the cancellation by President Carter of US plans for the B-1 bomber, the US with its aging fleet of B-52s and B-58s, has nothing to match the 'Backfire'. The Soviet Union has also deployed the very heavy missile SS-18. It has been estimated that 100 of these could wipe out the US's entire Minuteman fleet, which is now in fixed-land positions and forms the backbone of the US's strategic weapons.

The US, on the other hand, has put its trust in missiles under the sea. In place of the older Polaris and Poseidon missiles, a new generation of Trident missiles is ready for deployment. With these missiles (SLBMs) the US could hit Soviet targets even from submarines in the Indian Ocean. The US has also developed the Cruise missile. It is in effect a subsonic pilotless jet with a sophisticated guidance system which enables it to be taken under the existing radar shields.

What are the features of SALT II?

(1) The number of strategic weapons each side may have is restricted to 2,250. Such a restriction is of little significance. In terms of number, 2,250 strategic weapons are quite sufficient. SIPRI in its 1979 Yearbook concludes that the numbers of nuclear warheads "are now so huge that further increases have no military or strategic significance". At the same time, there is no restriction on the quality of the weapons. Older missiles are, and will continue to be, replaced by qualitatively better ones. The quantitative restriction is in fact only likely to give rise to a new quality race.

(2) The treaty restricts each side to developing only one more land-based system (ICBM) upto 1985. But there is no restriction on the development of SLBMs. The Soviets have already tested two new SLBMs, the SS-NX-17 and the SS-NX-18. The US, on the other hand, is developing a new long-range SLBM, the Trident-2.

(3) The Soviet Union tried to get cruise missiles (which are not deployed in Europe) limited to a maximum range of 600 kilometres. The treaty, however, only prohibits the deployment of long-range ground and sea-launched cruise missiles for the next three years. This prohibition is meaningless as even the US has not developed such missiles. Under the agreement, airborne cruise missiles are allowed.

(4) The Soviet 'Backfire' bomber, is a strategic weapon, is not covered under the treaty proper. It is covered only by a so-called "gentlemen's agreement".

(5) There is no restriction on the Soviet heavy missiles, the SS-18. The US has nothing comparable. As already pointed out, just 100 of these can destroy the entire US land-based missile system.

SALT I was ratified by the US Senate without much debate and with only two votes against it. SALT II, on the other hand, has led to a furious debate within US ruling circles. This debate has brought out the fact that US ruling circles are seriously divided on how to maintain US domination in the face of Soviet contention for world hegemony. Those who favour SALT argue that the treaty gives the Soviet Union a stake in preserving a stable world situation and that consequently the Soviet Union will be discouraged from undertaking aggressive adventures. According to them, each side is roughly equal in strength and therefore able to survive a first-strike and retaliate, causing unacceptable damage to the enemy. Such a 'balance of terror' or 'mutual assured destruction' (MAD), as it is now being called, will deter war, they hope.

The critics of SALT in the US argue that the Soviet Union's aim is not parity but superiority so as to be able to launch a first strike and survive retaliation. According to them, SALT II gives nuclear supriority to the Soviets. They argue that SALT in fact heightens the war-danger by allowing the Soviet Union to gain a credible first-strike capacity.

SALT II has also provoked a debate in Western Europe, whose security position is affected. In Europe, USSR has overwhelming superiority in conventional arms. The Warsaw Pact has 58 divisions in Central Europe against NATO's 28 divisions. Besides this disparity of 150,000 troops, the Soviet Union has in its Western military region some 33 divisions which (unlike the US divisions in America) can be immediately used as reinforcements.

The Warsaw Pact has 19,000 tanks and 2,800 warplanes against the West's 6,500 tanks and 1,750 warplanes. Further, the Soviet Union has another 8,517 tanks and 1,100 planes in its own western region. Recently, the Soviet Union has deployed two new battlefield missiles, the SS-21 and SS-22 which can be fitted with either nuclear or non-nuclear warheads.

So far the West was counting on its tactical nuclear missiles to counter the Soviet superiority in conventional arms. But the Soviet Union has recently deployed the SS-20, a mobile, intermediate range ballistic missile. It constitutes a threat to which Europe has no answer. The SS-20 is not covered under SALT, as the Soviet Union insisted that only those missiles capable of hitting the two countries (US and USSR) should be covered.

If the Soviet Union destroyed the tactical nuclear missiles in West Germany, would Britain and France use their few nuclear weapons and risk being attacked by the Soviet SS-20? In that case, would the US attempt to destroy the SS-20 missiles and thus run the risk of waging a nuclear war? In the face of such a situation, the former West German defence minister, Georg Leber, concluded that launching a conventional war against Western Europe, especially against West Germany, with little risk was 'workable' for the Soviet Union.

In the various disarmament talks the Soviet Union has tried to maintain its advance towards military superiority. A case in point is the Mutual Balanced Force Reduction (MSFR) talks which have been going on for many years. In this, the Soviet Union and the Warsaw Pact have refused to acknowledge that they have a clear superiority of about 150,000 troops. The West has proposed that the troops of the two sides should be reduced to a level of parity. The Warsaw Pact, in order to maintain its superiority, has proposed that each side reduce its troops proportionately. Recently, the Soviet Union has seemed to accept the NATO proposal, but with a catch — it has proposed that there should also be national sub-ceilings. This is aimed at West Germany which has the largest ground force in West Europe. Further, the troops in the western region of the Soviet Union are not, of course, to be covered under the troops reduction agreement.

The Soviet threat to West Europe has produced its impact on West Germany. Voices of appeasement have been raised, though they are still in a small minority. The leader of the ruling Social Democratic Party's parliamentary group, Herbert Wehner, recently went as far as to say that Soviet military superiority is "defensive" and arises from the need to "safeguard its spheres of influence in Europe". The West German foreign minister and others have, however, held that the Soviet military build-up "is characterised by its offensiveness".

Detente and arms reduction have not hindered the Soviet Union from stepping up its military pressure on Western Europe and trying to seize control of strategic points in order to outflank Europe. In the recent Soviet-backed Cuban and Vietnamese actions in Africa and Southeast Asia, the Soviet Union was not hindered by considerations of how SALT would proceed. It is some US ruling circles which, finding their once vaunted military superiority fast vanishing, are desperately hoping that by giving in somewhat to the Soviet Union they can maintain their worldwide domination. At the time of the Zaire incident, for instance, some among them had raised the question whether too strong a response to the Soviet-supported invasion would not endanger SALT

PERSPECTIVES

A Primer for Aid Recipients

Paul Streeten

"Because I am witty you must not imagine I am frivolous, and I will not imagine that because you are pompous you are therefore serious."
Sidney Smith to a bishop.

THIS short guide is written for aid recipients who wish to find their way through the political and bureaucratic jungle of donors' prejudices, myths, idiosyncracies and more sensible requirements.

The kings of Siam are said to have ruined obnoxious countries by presenting them with white elephants that had to be maintained at vast expense. In the modern setting this can be achieved best by tying a high-interest loan, called "aid", to projects and to donors' exports and by confining it to the import content or better still some part of it, of the project. But even untied aid on soft terms can be used to promote projects of a white elephantine nature, because capital grants do not cover the subsequent recurrent expenditure which the elephant inflicts on his owners. Receiving aid is not just like receiving an elephant but like making love to an elephant; there is no pleasure in it, you run the risk of being crushed and it takes years before you see the results.

Economists have correlated aid received per head with a number of characteristics of the recipient country. Valuable lessons can be learned from this exercise. If you wish to maximise aid received per head, you must become a very small country. If you are a member of a federation, break away. If you have an irredentist movement, encourage it. You must register a low temperature in the cold war, belong to NATO, CENTO, SEATO and as many other military pacts as possible. You must have a regime that declares that it is favourable to private enterprise. The fact that the public sector is in fact much larger in the countries that preach the virtue of private investment than it is in yours is quite irrelevant. You must attempt to get a high score on the check list of permormance criteria — except when it comes to population policy when it is non-performance that counts.

The final incidence of much aid is such that it benefits the donor, not the recipient. Aid, by raising demand for the exports of donors and by reducing demand for the exports of recipients while increasing their supply, tends to improve donors' terms of trade. Salaries of expatriate managers, technicians and administrators flow back into the countries from which they come. Tied loans are extended for goods at uncompetitive prices, but have to be repaid, with interest, in convertible very hard currency. Charity therefore may begin abroad, but sometimes ends up at home.

If aid is not given to benefit pressure groups in the donor countries, it is given to undo the harm done previously. According to a news item in *The Times* (February 16, 1966): "Vice President Humphrey of the United States announced a $ 50 mn loan for Pakistan to reduce pressure on the national economy caused by suspension of American economic assistance."

Much and a growing amount of aid

is given to finance repayments of past loans and interest payments on them. Gross figures for aid have grown, while the only relevant figure — the net transfer of resources — has declined.

A simple test is this: Whenever an overseas firm comes to you for a concession with the promise that it will raise your exports or encourage import substitution, and therefore be splendid for your balance of payments, check carefully what story it has told the authorities guarding the foreign exchange position in its mother country. Often you will find that the very same firm received permission to spend money abroad on the ground that the investment would strengthen the balance of payments of the capital exporting country. It may be the same firm that promises in its company report to export more from Britain, which also promises you to import less from Britain.

Many forms of aid received turn out, on closer inspection, to be aid given. Aid is, for this and other reasons, a three-letter word. Donors may lend you at 3 per cent and you hold sterling or dollar balances at 4 per cent. Aid from donors, surplus capacity means that you, the poor, are helping to reduce unemployment and to raise profits in the countries of the rich. The acceptance of food aid helps the party in power in the donor country to keep the farm vote, sometimes at the expense of your indigenous agriculture. Purchases of fertilisers keep important branches of the chemical industry in business. Aid-tying enables producers to raise prices against you and to acquire a captive market. Sending young and promising men to be trained, helps donors to staff their hospitals, factories and universities with the best of your brains.

Always look a gift horse in the mouth, for it may turn out to be Trojan. Or, as Ernest Bevin used to say, when you open the Pandora's Box, it is full of Trojan horses.

Many donors have promised to provide "financial resources ... of a minimum net amount approaching as nearly as possible to 1 per cent of [their] national income" (UNCTAD Recommendation, A IV 2). You must beware lest they will hit this target not by inflating aid, but by deflating their national income. The British government has said "we shall hope ... to be in a position to increase our aid to foreign countries ..." (Cmnd 2735, paragraph 5). The hope may be realised as a result of the break-up of the Commonwealth.

Much of what donors call "aid" is really aid to their own citizens. This covers loans and equity investment yielding handsome rates of return, though tabulated by the Development Assistance Committee of OECD as "aid". (It is rather as if, when buying a share of ICI, I enter the transaction as a charity.) In addition to this, aid covers part of the compensation paid to former colonial civil servants for loss of career when they retire when a country attains independence. Aid covers compensation to individuals and compaines who had claims to money, property or land in newly independent countries, which these countries did not meet. Compensation of British farmers in Kenya and the British South Africa Company in Zambia is counted as aid. If exporters, ever eager to sell, have acquired debts which cannot be repaid, and if their foolishly incurred debts are paid off by the British taxpayer, the payment is called aid to developing countires. Those who lost the war and pay reparations are also encouraged to count these damages paid to developing countries as aid

How to Succeed at Aid-Gathering

First, potential donors have to be identified and their peculiarities and idiosyncracies have to be studied so that proper requests can be made and the right types of representative be sent out. In order to make the right impression on aid agencies their motives and methods must be studied. Send out, for aid negotiations, representatives who resemble the donors, or rather resemble the image that donors have of themselves. The representatives should speak the same language, literally and metaphorically, appear to accept the same values and have the same manners as the donors. To appeal to Englishmen, he must show commonsense, be able to engage in small talk, not to be too serious, too clever, too articulate or too learned, laugh at the Englishmen's jokes, which will suggest that he has a sense of humour, not be too successful with women and not have oily hair. To appeal to Americans, he must be frank, manly, unpompous, good at the facts and figures and appear professional. To appeal to Germans, he should be hard-working, keen on private initiative and capable of formulating ideas in a coherent philosophical system with numerous categories, spelt out in long words with classifical derivations. (A subsequent primer will be devoted to what appeals to Russian and Chinese donors.) The more the representative approaches the image that each donor nation has of itself, while remaining properly deferential, the better his chances of success. It is useful to know the jargon: always say, and, more important, write: "absolute increases in income and income per capita are highly positively correlated with initial levels of income and income per capita" when you wish to say: the rich get richer. It is also useful to be familiar with the latest intellectual fads. To those who are impressed by the need to reform agriculture and limit population growth you must present programmes of land reform, large fertiliser purchases and cost-benefit calculation of the marginal sperm diverted. Others, eager to embark on thorough evaluation exercises, will be impressed if you can produce an evaluation of evaluaters. Whatever you propose to do, be ready with an evaluation.

But to send out acceptable negotiators, who can play golf, or drink beer or be prepared to picnic, and who could talk of the trade matrices, systems analysis, and gaps is not enough. They must be well-briefed, documents must be ready on time and letters must be answered.

Amongst the projects, some of the best ones will stand little chance of success, while some of the worst must. Agriculture, fishing or forestry projects may show low rates of return, sometimes long delayed, but can make large contributions to the economy as a whole. They will not be very popular with donors. Projects with a small import content make good use of local resources but, because of the local cost theology of donors, will not attract much foreign aid. Large residential universities, preferably on fertile agricultural land, planetariums, anditoria and other monuments to which labels can be attached, may have no (or negative) development impact but are dearly loved by donors. Administrative buildings, police houses and even, in some cases, prisons may be essential but to ask for them is a pretty hopeless quest.

In matching projects with your donors, you must also pay attention to their balance of payments position. It is easier to persuade surplus countries to finance the domestic content of a project than deficit donors. Projects with a high import content should therefore be sold to those with balance of payments deficits. Make good use of the skills which donors can supply. It is not much use asking a catholic

country for the pill, or one without a chemical industry for fertilisers, however important both pill and fertiliser may be. There is no point in asking for a project which requires for its execution managers whom the donor country is not able or willing to release. It is useful to employ knowledgeable aid consultants, preferably men who are familiar with the procedures of donors.

You do not have to know whether aid is given for military, altruistic, Machiavellian or profit-seeking reasons. But it is a great advantage to know something of the power games played in the corridors of the officers of the donor country and of the bargaining between different civil service departments concerned with the distribution of aid. If the recipient can add his weight at a crucial moment and at a crucial point in the process of decision-taking into a balance of consideration and power, he may be able to make a substantial difference. Such knowledge may have less to do with the merits of a case than with the idiosyncracies of ministers and their senior officials and with the state of bargaining on quite different fronts.

You must try to maximise the number of donors and aid channels. Although this adds to your administrative work, it makes it possible to play one against the other and to encourage them to compete. The larger the number of channels, the greater the number of vested interests and therefore the larger is likely to be the flow of aid. Always oppose efforts to co-ordinate, streamline, or integrate aid-giving activities and institutions. More difficult is the creation of the right kind of political climate. To the Americans and to the Germans, you must convey the impression that you are helping yourself; then Uncle Sam and Onkel Michel may wish to push the car you have started. To the World Bank and other donors, you must present consistent national plans. National planning, irrespective of the plans of other nations and some times inconsistent with these plans, is the modern equivalent of 19th century *laissez-faire*. You may be forced to repeat and perpetuate myths, such as that your borrowing is only for import of capital goods, or for projects that "pay for themselves"; that all the money will be spent on the donor's products, and on his chosen projects, etc. Most important of all, you must perpetuate the myth that you will "take-off" within a specified period and that all aid will then come to a happy end.

If you have a good agricultural engineer or a good expert on fisheries, and you wish to do him a good turn recruit him for a UN technical assistance programme and ask for a similar expert from another underdeveloped country. Admittedly, both will be less effective in the foreign land, but their multiple salaries will be untaxed and paid for mainly out of rich countries' UN contributions. The more swapping of this type you can engineer, the higher the standard of living of your exports, though admittedly their contribution to development is reduced.

Knowing the Mythology of Aid

It is useful to know the prevailing mythology of aid.

There has been a good deal of discussion of the harm done by project and procurement tying. No doubt, a combination of these two forms of tying can greatly reduce the value of aid to recipients, and either of the who by itself is harmful. But success either in project tying or in procurement tying is limited, the limitation depending on a number of factors such as the stage of development of your country, the volume of your trade with the donor, etc. Project tying is limited by the fact that the donor's money only apparently finances a high priority project, while in fact it would have been carried out in any case with funds which are now freed for some low priority activity. Similarly, the possibility of switching always exists with procurement tying. Free foreign exchange earned through exports can be diverted to purchases from other countries, while the tied loan is used to buy what would have been bought in any case.

Another myth is the notion that, to achieve development, aid-financed imports must be capital goods. It is of course true that many underdeveloped countries cannot produce capital goods themselves, or only at excessively high costs. But the development problem is how to feed the workers who do the construction of investment goods, while consumption levels generally are very low. And to finance this surplus by importing food from abroad may make as great a contribution to development as importing the capital goods.

It is also said that you should borrow only for projects that yield exportable goods. Even where balance of payments relief is the main consideration, the whole balance of payments position must be considered. Any contribution to domestic production which, directly or indirectly, reduces dependence on imports, is just as useful as the production of exports.

It is further said that you should borrow only for projects that "pay for themselves" so that revenue collected is sufficient to service the debt. But again, it is not the revenue collected from the aid-financed project but the total public revenue position that matters. If taxation from other sources can be raised sufficiently, there is no reason why a non-self-liquidating project, such as many agricultural or educational projects, should not be undertaken.

The donors' jargon of "taking off" into self-sustained growth serves psychological and political needs, but not analysis. As long as it is merely a rationalisation of donors' hopes to be rid of aid before too long, no great harm may be done. Even then, it may be better to educate opinion gradually by getting it to accept not only the permanent justification of capital flows across national boundaries, for there is no reason why each nation should be self-sufficient with respect to its capital requirements, but also towards the international solidarity which would enable it to envisage the possibility of an international system of taxes and subsidies on a pattern which has become generally accepted within advanced nation states. But the notion of "take off" can carry misleading implications for current policy. It may give the impression that there is something inevitable or very easy in sustaining growth, once a critical point has been reached. Even when we adhere to the aeroplane metaphor, we must remember that crashes occur. There is nothing automatic in sustaining development once certain savings and investment ratios have been achieved. Equally, "preparing the runway", by gradually building up local institutions, skilled and honest administrative services, an entrepreneurial class interested in building large-scale enterprises and in producing rather than trading a reform-minded peasantry, etc, may be an essential prerequisite for development, but show slight or no returns in terms of the ratios normally used to indicate distance from "take-off". There can be a good deal of development without growth, just as there can be growth without development. The metaphor taken from aeronautics can be adapted, but it is usually wiser to touch down from motoring or flying analogies and to ask who does what to whom, when and why. Eschatology is no substitute for policy.

Explaining Price Behaviour

D M Nachane

Behaviour of Prices in India, 1952-70 by Shanti K Chakrabarti; The Macmillan Company of India, 1977; pp xii + 202, Rs 50.

THIS book is a revised version of a PhD thesis submitted by the author to the London School of Economics in 1970 and is an attempt to identify major influence affecting prices, since the inception of planning in India. At the outset it must be mentioned that the author deserves praise for attempting to tackle an extremely complex problem. He has taken considerable pains to collect a large volume of data, has made a deep study of the market and other institutional forces operating in the Indian economy, and the econometric tools that he employs are well-chiselled. Unlike many econometricians, he is fully aware of the various limitations of his model and constantly draws attention to them. Nevertheless the work can be faulted on several details, and the reviewer has serious misgivings about certain aspects of the model.

AGRICULTURAL SECTOR

The general price level P is sought to be explained in terms of three major sectoral price indices (i) P_f, wholesale price index of cereals, (ii) P_i, wholesale price index of manufactures and (iii) P_m, wholesale index of industrial raw materials. Since data on many items of food products was not easily available for the early years of the sample, the author chooses to work in terms of the price index of cereals alone. Using the prices of manufactures as a deflator the author proposes a multiple regression model to explain the relative of cereals by treating the cereals market as one in which a market-clearing price is established by the forces of demand and supply. To take account of the population variable, per capita magnitudes are used. The demand function of cereals is assumed to be of the form

$$D_t = \eta\, y_{n,t} + \epsilon (RP)_t \qquad (1)$$

where D is the per capita demand for cereals from the non-cultivating population $y_{n,t}$ is per capita non-agricultural real income and $(RP)_t$ is the relative price of cereals (in terms of manufactures).

The supply of cereals in the market is given by

$$S_t = (1-w)\, Q_t - C_t - \Delta K_t \qquad (2)$$

where S_t is the supply, Q_t is total production, w is the fraction of output of cereals used as seed, livestock feed etc, C_t is the cultivators' own consumption, K_t is the year-end stocks with traders and cultivators, and ΔK_t stands for the change in such stocks. The change in stocks ΔK_t is explained by the following equation

$$\Delta K_t = \sigma (Q_t - Q_{t-1}) + m [RP_t - RP_{t-1}] \qquad (3)$$

Equations (1), (2), and (3) combined with the market-clearing equation $D_t = S_t$ yield the reduced form equation for RP_t as

$$RP_t = a_1 y_{n,t} + a_2 Q_t + a_3 Q_{t-1} + a_4 RP_{t-1} \qquad (4)$$

Allowing for the possibility of imports and the fact that a part of the consumption of cereals is *via* ration/fair price shops at subsidised prices, equation (4) can be suitably modified to yield

$$RP_t = h_1 y_{n,t} + h_2 Q_{1,t} + h_3 Q_{1,t-1} + h_4 RP_{t-1} - h_5 d_t \qquad (5)$$

where Q_1 is the total availability of cereals including imports and d_t is the amount distributed through ration shops as a percentage of toal availability.

At this stage, let us pause to critically examine some of the aspects of Chakrabarti's model. First, the decision to use the price of manufactures as a deflator. The author cites three reasons in support of this choice "(a) the relative price that we obtain thereby has some interest of its own (b) it is a better indicator of the real income of farmers than either of the other 2 deflators (*viz*, general price index and working class consumer price index) and (c) the statistical results are better for this relative price".

Of these, I think, only (b) merits serious consideration. The manufactures price index would be a superior deflator as compared to the general price index only if cereal growers spent a substantial portion of their incomes on manufactures. The data available, however points in a different direction. Thus, a study by John Mellor and Uma Lele (*Indian Journal of Agricultural Economics*, Jan-Mar 1973) indicates that agriculturists with holdings of less than 5 acres spent about 60 per cent of their income on agricultural commodities and only 40 per cent on non-agricultural commodities. For farmers owning between 5 to 10 acres the figures were 52 per cent on agricultural commodities and 48 per cent on non-agricultural commodities. (This class might probably represent the model class for cereal cultivators.) It is only large farmers owning more than 30 acres for whom the proportion of income spent on manufactures was substantially high (about 65 per cent). (The reference year for the study is 1964-65.) These facts cast considerable doubt on the suitability of the price index f manufactures as a deflator, the general price index or alternatively the cost-of-living index might have been more appropriate.

Turning now to a more serious anomaly, an examination of equations (1) and (2) above reveals that the consumption of cereals by a substantial proportion of the agricultural population, which is engaged in the production of non-cereals is unaccounted for. The observation by M L Dantvala (*Indian Economic Journal*, Oct-Dec 1970), made in a slightly different context, is very relevant here. According to him, it is not just urbanites but many of the rural population who are dependent on the market for a significant share of their food requirements. The following Table compiled by C V Achuthan shows the proportion of income generated in the non-cereals sector as a percentage of total agricultural income to be around 40 per cent.

	Year 69-70 (Per Cent of Total Agricultural Income)	Year 70-71 (Per Cent of Total Agricultural Income)
Rice	31.67	32.12
Jowar	4.74	5.92
Bajra	3.25	2.68
Maize	2.44	2.56
Ragi	1.09	1.03
Small millets	0.90	0.99
Wheat	14.03	11.89
Barley	0.98	1.15
Total (cereals)	59.10	58.34
Gram	3.49	3.76
Tur	1.19	1.31
Other pulses	3.02	3.15
Total (pulses)	7.70	8.22
Groundnut	7.82	7.94
Other oilseeds	3.55	2.94
Total (oilseeds)	11.37	10.88
	69.70	70.71
Cotton	6.26	6.57
Jute	0.97	0.95
Sugarcane (gur)	8.47	8.65
Tobacco	2.06	2.15
Tea	1.68	1.72
Coconut	2.38	2.51
Total	99.99	99.99

Thus the non-cereals sector accounts for a substantial portion of the total income generated in agriculture. By leaving out the demand for cereals from this section of the populace (which incidentally would have an income-elasticity of demand for cereals ranging between 0.5 for the middle-income groups and about 0.9 for the lower income groups) the empirical reliability of Chakrabarti's model is reduced considerably.

Chakrabarti's analysis regarding the speculative activities of traders also leaves much to be desired. To quote from the book (p 38): "Theoretically also since the Indian cereals market is composed of many small traders it is unlikely that any individual trader would hope to be able to force the price up by a policy of withholding supplies from the market. There may, of course, be some limited degrees of local monopoly power of wholesale traders and there may also be some facit understanding among them about the marketing policy. Assuming that there is such a monopoly element in trading, it can be shown that the traders can increase their total sales revenue over the year by making the distribution of sales over the different seasons more unequal, provided that the price elasticity of demand for cereals is constant and less than unity in absolute value. But then profits will be higher if more is sold in the beginning and less later, because thereby the traders economise in carrying costs. A policy of withholding supplies from the market will therefore be irrational for the traders unless the stocks are actually destroyed." The argument is sought to be buttressed with a mathematical model but is again liable to leave the reader with a lot of lingering doubts. What for example is the rationale of assuming that the price elasticity of demand for cereals is constant especially in periods of acute shortages, when speculative activity is likely to be most pronounced? Again, what is one to make of a statement like the following one (p 39 footnote): "If prices are expected to rise later, this is an additional reason why the monopolist trader will try to sell more earlier than later", uness the statement is a misprint? And, finally, has the public distribution system contributed in any way to the mitigation of the speculative pressures? I think, Chakrabarti's analysis in this regard is fallacious and misleading. The issue of speculation in foodgrains really cannnot be discussed in the context of an annual aggregative model of the type developed in the book.

Manufacturing Sector

Turning to the manufacturing sector, one finds considerable merit in the author's basic hypothesis that prices of manufactures are determined by a rule of marking-up unit prime costs. This is a refreshing alternative to the usual explanation in terms of a competitive apparatus. In the Indian context, with government regulation being an important feature of industrial policy and with the trade associations playing a dominant role, the mark-up hypothesis is likely to be the most suitable explanation. But here again the issues are clouded by the author's decision to work in an aggregative framework, employing time-series data. An examination of the mark-up hypothesis for different industries like jute, cement, textiles, etc, would have been much more illuminating from the point of view of both policy-makers as well as academic economists. It is to be hoped that this work will act as the lead for researchers to undertake an examination of industry-specific roles of the mark-up hypothesis.

Chakrabarti's approach is to explain the wholesale price index primarily in terms of the following variables (1) unit wage cost of output, (2) wholesale price index of industrial raw materials, (3) per capita money supply, and (4) unit value index of raw material imports.

Further the wage costs and prices of raw materials are explained in terms of certain other factors. The level of wages is sought to be explained in terms of the (i) cost-of-living index number and (ii) the index of output per worker. The relevant equation (p 107 of Chakrabarti's book) is reproduced below

$$w_t = -0.5378 + 0.8612\, P_{c,t-1} + 0.4036\, A_t = \bar{R}^2 = 0.8792.$$

where w_t, $P_{c,t-1}$ and A_t are respectively the per capita earning of workers, cost-of-living index (All India General Working Class Consumer Price Index Number) and index of output per worker. For statistical reasons (as the author himself admits), the co-efficient of $P_{c,t-1}$ could be biased upwards considerably. The upward bias may be present to a lesser extent in the case of the co-efficient of A_t. But here again, the crux of the matter seems to be that the aggregate approach is a blanket that could conceal a variety of situations arising in different industries. The extent of unionisation for example, might determine to what extent in a particular industry, gains in productivity or rises in cost-of-living get reflected in the wage-rate. Since automatic escalation clauses are only recently emerging (and they were certainly insignificant over the time-period covered in the book), the wage levels in specific industries in the organised sector have been fixed as a resultant of the process of union-management bargaining, with the rise in the cost of living and increases in productivity having very little influence, if at all. An approach studying each industry separately is therefore necessary before one places any confidence in aggregative results.

The price of raw materials is explained by regressing this price on the ratio of industrial production to production of raw materials. Rather surprising is the complete omission of the transport costs in the explanation of the raw material price. This factor can often account for a substantial portion of the wholesale price of raw materials. Thus according to the Report of Inter-Ministerial Group on Freight Equalisation of Commodities (Government of India 1977), freight accounted for 21 per cent of the wholesale price in the case of pig iron, 21.4 per cent in the case of cement, 9.8 per cent in the case of steel (structurals), 54 5 per cent in the case of coal (Grade I). Even in the case of raw cotton, units in Porbandar for example, reported freight costs of about 5 per cent of the price. (See Report, *op cit*, pp 16-17 and annexure VII.) Here again, the limitations of an aggregative analysis are abundantly clear. The incidence of transport costs will not only vary over industries but also in the same industry, freight costs may differ substantially for units located in different regions.

The final part of the book is devoted to bringing together the various aspects of the model, estimating the equations simultaneously *via* the Two-Stage Least Squares Method and working out the policy implications of the model. While the reviewer is in full agreement with the author's scepticism regarding the notion of a 'safe' limit to the expansion of money supply, he has misgivings (some of which are shared by the author himself) about basing actual policy measures on the basis of an aggregative time-series model.

The main value of the book is in the fact that it is one of the few worthwhile attempts to explore a complex

economic phenomenon via a large-scale econometric model. As in the case of any pioneering effort, it is not free of defects. Possibly the most useful outcome of this work will be to motivate other researchers to devise ways around the pitfalls and to develop more elaborate models to take account of the multi-faceted complexity of the economics of the real world.

A Murdered Model

Gail Omvedt

Kampuchea: Rationale of a Rural Policy by Malcolm Caldwell; Janata Prachuranalu, Hyderabad, 1979; pp 91 plus footnotes, Rs 6.

THE threat of famine hangs over Kampuchea today. And it is a terrible irony that this time it comes not with an imperialist invasion but on the heels of a "socialist" one, and not simply because the armies have disrupted agricultural production but as the result of a deliberate developmental policy emphasising high-technology "modernisation" (Kampuchea is slated to join the Mekong Development Project once Vietnam can convince the other members to let it in) and integration with the world market economy with all its implications, including allowing all the middle class bureaucrats and "experts" to return to Pnomh Penh. Even more pathetic is the recent statement of the Vice-Minister for Foreign Affairs illustrating the accepted new dependence: "We cannot rebuild our country with our own hands. We need the help of socialist nations and peace-loving peoples all over the world We need the assistance of all the peoples and organisations of the world" (*Times of India*, May 26). It is as if Kampuchea were Bangladesh in 1973-74 — a beggar before the world.

What is the significance of this? It can no longer be denied that the Communist Party of Kampuchea (known in the bourgeois and revisionist press as the "Pol Pot regime") was overthrown not by a popular uprising but by over a hundred thousand Vietnamese soldiers. It would seem hard to justify this on Marxist principles. Particularly if one wants to condemn the Chinese aggression — marching 50 to 100 miles inside the territory of a country, capturing a few important towns, then retreating —, justifying a permanent occupation would seem almost impossible. As if a burglar is a criminal, but someone who murders the head of a household and occupies his place is a liberator (or a saviour, since the term is "national salvation" as opposed to "national liberation").

The justification has been on moral principles — by claiming that the Kampuchean Communists were "mass murderers" responsible for the deaths of millions of their own people and for serving imperialist interests in wanton attacks on Vietnamese borders. Unfortunately this justification has convinced very few — it has not convinced the majority of Third World countries, it has not convinced even independent neighbouring Asian communists such as the Democratic Peoples' Republic of Korea (which condemned the invasion) or the Communist Parties of Thailand and Malaysia.

And it has not convinced the independent Marxist or progressive scholars in Europe and the US who first analysed and replied to the propaganda against Kampuchea when it was originated by the imperialists — scholars such as George Hildebrand, Gareth Porter, Noam Chomsky and many others who showed not only that these slanders had little basis in fact but that to the contrary the Kampuchean revolution was laying the basis for avoiding starvation and disease. Most of such scholars have come to the defence of Kampuchea recently — out of a simple loyalty to the facts, because the Vietnamese have produced no *new* evidence to justify their actions, and not because they themselves are committed to a "pro-Chinese" or any other position.

Of these Marxist scholars, certainly the most committed in terms of his long-term service to the Asian revolutionary cause was Malcolm Caldwell. Caldwell paid for his convictions with his life last December, but his voice is not so easily silenced. What is probably his last work — a paper originally written for a seminar in Bielefeld, Germany in April 1978 — is now available in India as a 100-page small book for the nominal cost of Rs 6 from Hyderabad.

The book deserves to be widely read, not simply by those who want to "defend Kampuchea", but because it discusses the fundamental issue of *the model of development* (perhaps "line" would be more accurate) which should be followed after a revolution, a line which determines the nature of the "transition to socialism", which may even determine whether this transition is to occur at all For Caldwell himself does not simply "defend" the Kampuchean revolution; he sees it as going on the path which must be followed, as "one of the most significant early indications of the great and necessary change beginning to convulse the world in the later 20th century and to shift from a disaster-bound course to one holding out promise of a better future for us all".

Why is this? Because the Kampucheans were following a policy in which the development of industry and trade were to be organically linked to a self-sufficient agriculture — and hence *autonomy* in food production — as a necessary base. Caldwell does not say much about what this means in class terms (except to stress the criteria that all must have access to land and the means of production in agriculture) and hence about Kampuchea's commune-barter economy, perhaps because this is a factor that would vary with the class structure and stage of development at the time of revolution.

But he is clear that such a path has become necessary today, if even the parimary goal of feeding a nation's people is to be achieved. The alternative, according to him, is to be caught in the net of international imperialism which in its current stage necessarily involves agricultural export-dependence and the depressing of living standards of the rural majority (and urban poor) to the point of starvation. India, exporting beef, goats, vegetables, fruits and a projected one million tons of foodgrains a year while countless numbers of agricultural labourers survive on one meal a day and a rampant Hindu chauvinism threatens to deprive them of one source of protein and burden the rural population with more aged cows, is an example of this. But its solution is not achieved by the simple fact of a "revolutionary" party coming to power, rather by the nature of the policy followed by that party.

Caldwell's thesis links this argument with issues raised in the fight against '*overdevelopment*' *in imperialist* centres (now highlighted in the anti-nuclear movement in the US). It raises some questions that it does not answer — particularly in regard to the problems and position of present-day "socialist" regimes within the imperialist system, and in regard to the issue of relations of production and class struggle in post-revolutionary regimes. But it is an important work, even if in many ways an unfinished one — and the tragic significance of the present famine and food-dependence of Kampuchea is precisely to highlight this significance.

Rural Employment: Facts and Issues

M L Dantwala

Any employment strategy, to be effective, has to be based on a close understanding of the characteristics of various types of unemployments, tracing them to their root causes, particularly the inequitous social and economic structure and inequitous institutional set-up.

Here we shall note and comment upon two or three salient features of the unemployment situation, and certain relationships between the incidence of unemployment and some of the characteristics of the labour force.

ERADICATION of poverty and unemployment has been a major goal of development planning since its inception in our country. The success achieved in the realisation of this goal has been patently disappointing. Judging by the economic policy statements of the Janata government and the Draft Five Year Plan: 1978-83, it appears that more earnest efforts will now be made to tackle the problem. Some decisive policy shifts have been introduced to make a more visible impact on the problem during the Plan period. As a result, it is expected that by 1982-83, the 'employment gap' will be reduced from 40.7 million 'standard years' to 15.5 million 'standard years' in 1982-83.

The employment strategy for reducing unemployment has three basic ingredients: (1) a policy to maintain the highest feasible rate of growth, (2) a policy to make the pattern of production more labour-intensive, and (3) a policy to regulate the technological change so that the rate of growth of employment is maintained at a satisfactory level. No one can demur against a policy statement at this level of abstraction. At a somewhat more concrete level, it is stated that "the employment-content of the structure of production is sought to be increased by redirecting private demand through redistribution of purchasing power and public demand through greater expansion of public services". Redistribution of purchasing power is sought to be achieved through "accelerated implementation of land reform, differential input supply policy favouring small farmers, the minimum needs programme and the public distribution system" [8]. All this is expected to increase the demand for labour-intensive goods.

Our major grievance against the estimates of employment and unemployment made by the Planning Commission is that they are too aggregative and therefore fail to reveal the highly heterogeneous character of the unemployment situation. If the problem of unemployment is to be effectively tackled, this heterogeneity should be thoroughly understood. The macro policies like massive shift in public outlay in favour of rural areas and encouragement of labour-intensive technology may not decisively redistribute purchasing power in favour of the lower income group, unless such policies are backed by appropriate organisational mobilisation and institutional changes.

Economists now understand that unemployment cannot be eliminated merely by pumping in purchasing power in the economy, but they may still find it difficult to accept that a policy of generating a certain aggregate number of jobs or even person-days of employment may not necessarily bring about a corresponding reduction in unemployment. Unemployment or demand for jobs is highly dispersed not only regionally (which everyone knows) but also by age, sex and class of worker. Besides being widely dispersed, it is fragmented in terms of timing and duration for a large number of the unemployed, except those who are chronically unemployed. What is therefore of essence in employment planning is to match employment generation with demand for work, if not for each individual, at least for each major category of the unemployed. We have, I presume, by now understood the distinction between additional jobs and additional person-days of employment. The distinction between the number of unemployed persons and the number of person-weeks or person-days of unemployment was driven home, against much academic resistance. A large majority of persons in the 'labour market' may not want new jobs, they want more stable — and more remunerative — employment in their existing or allied occupations. Of course, if driven to the wall, as during a famine or severe drought, they would accept whatever is offered and would be "willing" to move wherever the planner would move them. During normal times, their behaviour is found to be quite different. Thus, in the current year (1978-79) the gap between the number of persons who have *registered* themselves under Maharashtra's Employment Guarantee Scheme (EGS) and those amongst them who actually *reported* for work has been quite substantial. The number of persons registered in the current year was about 28 lakhs. The average attendance in various works under the EGS was about 5.2 lakhs, the maximum being about 7.69 lakhs. It would be interesting to know how many of these 28 lakh registered work-seekers had reported for work and the distribution of such persons according to the number of days for which they were employed (a) under the EGS or (b) elsewhere. A systematic districtwise and projectwise record of variations in the attendance of registered (and unregistered) job-seekers and its seasonal pattern would provide rich material for employment planning.

In sum, employment strategy to be effective has to be based on the understanding of the characteristics of various types of unemployments (the choice of the plural is deliberate), tracing them to their root causes, particularly the inequitous social and economic structure and inequitous institutional set-up.

It is necessary to remember a very elementary fact that all the millions of days of additional employment sought to be created under the Sixth Plan have to be provided to the unemployed and under-employed in the five and a half lakh villages of India. Therefore, the most critical issues in employment planning are not only the magnitude of the aggregate employment generation and its sectoral distribution but also its spatial and occupational spread It should be admitted that there are

TABLE 1: UNEMPLOYED AS A PERCENTAGE OF PERSONS IN FORCE
(AGE GROUP: 15-59)

	Rural		U
	Male	Female	Male
Daily Activity (Person-days)	7.32	8.89	9.85
Weekly Activity (Person-weeks)	3.68	3.41	7.41

many constraints on such matching of employment generation with the variegated needs and limitations of the unemployed and the under-employed. The important limiting factors would be the inadequacy of natural endowments of the area and the capabilities and aptitudes of those in need of work. It may be possible to overcome the latter constraint to some extent through an appropriate programme of training and skill formation. Beyond that some migration of population in a planned and purposeful manner may be inevitable. However, an important desideratum of this strategy of tailoring employment generation to the needs and aptitudes of the people within the limits of the development potential of the area is a genuine commitment to the establishment of a competent planning authority and implementing machinery at the district or block level. Consonant macro policies are no doubt equally important. Vyas and Mathai [24] have advanced another cogent argument for decentralised planning. Planning at the micro level, they argue, enables planning of various activities "in a mutually supportive manner" and thereby enhances the productivity of each individual activity. The obvious example is that of power and irrigation or irrigation and land shaping.

The Planning Commission certainly knows this and has therefore attached a great deal of importance to block-level planning, thus acknowledging its own limitations as a remote central planning agency. The Planning Commission can, at best, analyse the problem, allocate resources for its solution, devise a policy frame, and provide technical guidance. But the rest, particularly actual implementation, has to be at a much disaggregated level.

Obviously, we cannot rest content with the general statement that unemployment is a heterogeneous phenomenon. We should, to the best of our ability, put together as much information as is available on the different facets of the unemployment situation, analyse it and spell out its policy implications. other crops (8.16 million) and other agricultural sectors (12.23 million), i.e, in activities in which only a small percentage of labour force is presently absorbed.

How realistic are these projections? What does the past experience suggest? In discussing this issue following types of questions would be of interest. What is the impact of level of agricultural output on employment? What is the relationship between the level of agricultural production and the incidence of unemployment?

There cannot be any unique relationship between the level of agricultural output or its growth rate on the one hand and employment on the other. Apart from the variations in the basic agronomic (soil-climate) conditions, the type of techniques and technology of agricultural production and its class bias would be important determinants of the employment effect. In simple language, what would matter is where (apart from agronomic conditions), how and for whom the growth takes place. Besides, in the discussion on labour input in agriculture, it is important to bear in mind the distinction among (1) labour input per unit of cropped area, (2) labour input per unit of cultivated area and (3) labour input per unit of output [5]. In what follows, we cite the findings of a few studies which relate the impact of agricultural development in India since the early fifties on employment. The studies though painstaking should be read with a great deal of caution. Findings of some of the studies [2, 4, 20] have been questioned by many scholars on grounds of conceptual infirmity, doubtful data base and methodological flaws.[1] In spite of this we felt that it would be worthwhile to get acquainted with them.

LEVEL OF OUTPUT AND EMPLOYMENT

Lakdawala has stated that the elasticity of person-day employment per hectare with respect to output (kg per ha) is negative at (—) 0.94 to 0.97 for all regions (—) 1.86 for developed regions. It may be however noted that though the per hectare output-employment relationship is negative, "with a quantum jump in output levels, employment generated may still be quite high".

Parthasarathy examines the same sets of data as are examined by Lakdawala. Aggregating the region/district data for the relevant states, he finds that in 7 out of 16 states, the relationship between rates of unemployment and output per hectare is positive, negative in 4 and no firm relationship

is found for the remaining 5 states. Aggregation of region/district data of relevant states however is likely to vitiate comparisons and therefore the finding.

Vyas and Mathai confirm that though on an aggregate basis they did not find a statistically significant relationship between increase in agricultural production and agricultural employment [24], the results based on more localised studies, with firmer data base, show output employment elasticities in the range of 0.3 to 0.7. "The study of output-employment relationship, conducted in connections with the Second Asian Agricultural Survey, suggests a figure in the range of 0.4 to 0.6 per cent in the more labour intensive countries of Southeast Asia. For a country like India a figure of 0.5 may be more realistic". It may be noted that the Draft Plan has assumed almost 1 to 1 relationship between growth in agricultural output (4 per cent per annum) and growth in employment in agriculture and allied sectors (4.22 per cent per annum).

Mehra [14] and Vaidyanathan [20] find that over a period of time, labour input per hectare for *individual crops* has declined. Mehra's study reveals that "the decline in labour input per hectare in he 1960s over that of the 1950s is about 24 per cent for *deshi* wheat, 21 per cent for American cotton and 15 per cent for *deshi* cotton". Vaidyanathan, also finds that in the three districts for which the Farm Management Survey can be compared over time, namely, Muzaffarnagar, Ferozepur and Coimbatore, human labour days per gross cropped hectare had fallen for individual crops — wheat, paddy, sugarcane, cotton and groundnuts — between Period I (1954-55 to 1956-57) and Period II (1966-68 for Muzaffarnagar, 1967-70 for Ferozepur and 1970-73 for Coimbatore).

Mehra however finds that for all crops taken together, labour input per cultivated hectare has increased over time. For example, she reports that overall labour input per cultivated hectare in Ferozepur increased by about 40 per cent (by 22.94 man-days) between 1966-67 and 1969-70 and the mid-1950s. Out of the increase of 22.94 man-days per cultivated hectare, 7.87 man-days are attributed to the increase in the cropping intensity and the rest, i e, 15.07 man-days, to increased application of labour to individual crops resulting from (a) expansion of irrigation, (b) new technology and (c) associated changes in the cropping pattern. Mehra attributes 46 per cent (10.56 man-days) of the overall increase (22.94 man-days) in labour input to irrigation: 4.72 man-days *via* increase in cropping intensity and 5.84 man-days *via* increased input on individual crops. The remaining 54 per cent (or 12.38 man-days) of the increase is attributed to new technology and change in the cropping pattern induced by it: 3.15 man-days to the former and 9.23 man-days to the latter. She concludes: "the hand of new technology in increasing the employment of human labour on farms does not in the main appear to be operating directly but indirectly *via* changes in the cropping pattern".

Using Farm Management Survey data for 17 districts, Vaidyanathan [20] has tested the following hypotheses: the level of human labour input is determined by (a) level of productivity per unit area, taken as a proxy for the more fundamental determinants (namely the quality of land, agro-climatic conditions and other physycal inputs) of total energy inputs needed for crop husbandry; (b) the use of energy resources other than human labour; and (c) the relative costs and efficiencies of different energy sources.

Vaidyanathan tests his hypothesis through a variety of data sets and methodology. His *inter-district* cross-section analysis shows that correlation co-efficients between human labour days per hectare (HLD/ha) and yield per hectare has a positive sign (+0.37), but the co-efficients are not statistically significant. The multiple regression analysis however shows that the yield per hectare has a significantly positive relation with human labour input. But Vaidyanathan's explanatory variables — output/ha, bullock labour days (BLD)/ha, cost of human labour relative to animal labour, and horsepower/ha — explain no more than 40 per cent of the variations in human labour input. Introduction of another variable — proportion of area under paddy and sugarcane as a proxy for variations in cropping pattern — does not improve the significance of relationships.

Changing over to the analysis of *intra-district* variations in labour input, Vaidyanathan finds that human labour input and production per hectare are positively associated in most (11 out of 14) districts for which data are available. The correlation is statistically significant in five cases, and not significant in the other six. Of the other three districts where the correlation is negative, the co-efficient is significant only in one district.

The picture is much the same when the data for different districts or zones (combining districts) are pooled size-classwise. The intensity of human labour is positively associated with productivity in 5 out of 6 cases, and significantly so in 4 of them. Multiple regression analysis also shows that production per hectare has significant positive influence on labour absorption in half the groups.

Vaidyanathan sums up his findings by observing that "the analysis corroborates Ishikawa's hypothesis that in general the intensity of human labour input tends to rise as yields per acre increases. But the relation does not hold in all cases, nor is it as strong as one might expect. The relation seems to hold better when inter-district variations rather than intra-district variations are considered".

Bardhan [4] however finds that in the Hoogly district of West Bengal, between 1956-57 and 1970-71, input of human labour per year per acre of cultivated area nearly doubled, and more than trebled in small farms not exceeding three-quarters of an acre. This phenomenal increase in the intensity of labour input per hectare over a period of less than 15 years was a consequence of extension in irrigation in surveyed farms from 15 per cent of sown area to 55 per cent, diversification in the cropping pattern in favour of potato, wheat and summer paddy and an increase in the cropping intensity index from 1.23 to 1.53.

A significant finding of Vaidyanathan's study pertains to the differential impact of increased production on the use of family labour and hired labour. "There is some indication that between Period I and II the intensity of family labour participation in cultivation may have declined both in terms of Labour Force Participation Rate (LFPR) in cultivating households and of the average number of days per annum for which farm family labour is employed." Correspondingly, "in general", the proportion of hired labour in the total labour used in crop production has increased sharply in three (out of four) districts. In Coimbatore the increase was from 26.2 per cent to 84.9 per cent. In Muzaffarnagar, however "the labour force participation rate in farm families has risen sharply (from 31 to 49 per cent), while the average annual employment per adult male has fallen (from 287 to 190 days)". The phenomenal rise in the hired labour

component of the total labour input is associated with a general tendency in all districts for increase in the size of operational holdings and a sharp reduction — especially in Ferozepur and Coimbatore — in land cultivated under tenancy arrangement. How far these phenomena, particularly the former, is the result of sampling design in the second series of FMS is a point which would need further investigation. See Saini [18].

Vaidyanathan interprets "the significant rise in the ratio of hired to total input as an indication of growing proletarianisation of agricultural labour force". It seems to us that the latter, even if it is a fact, does not necessarily follow from the first. It is possible that if employment opportunities in non-farm employment become attractive, a part of family labour may be hired out for such work (see Ishikawa [11], p 81) and replaced by cheaper hiring in of landless labour. Alternatively, the observed change may be an indication of higher leisure preference among the large sized farmer. A more exacting regimen of farming operations under the HYV technology may favour hired labour *vis-a-vis* family labour especially female labour. Proletarianisation would be reflected more in the incidence of unemployment rather than in increasing proportion of hired labour to total labour input in agriculture. It must, however, be noted that in all the three districts, the average farm business income from crop production per man-day of work contributed by members of the cultivators' family has risen much faster than the average daily wage rate per man-day of hired labour In Muzaffarnagar the former rose nearly ten times as much as the latter and in Ferozepur and Coimbatore by 2 and 2½ times. The moral is clear enough The emphasis on agricultural development is not enough, as much, if not more, attention needs to be given to the distribution of gains from development not merely in terms of employment but also income.

Level of Output and Incidence of Unemployment

Let us now attempt to identify the relationship between the level of output per hectare and the incidence of unemployment. Normally one would expect that a relatively prosperous agriculture would help to reduce both poverty and unemployment. Empirical evidence however does not lend support to this expectation. Table VI in Lakdawala's Presidential Address [12] provides data for 65 NSS regions in respect of (1) agricultural output per hectare — from JNU-PPD Study and (2) unemployment rate (in person-days) as per 27th Round of the NSS. The correlation co-efficient between the two turns out to be positive at 0.30 (significant at 5 per rent level), which implies that higher agricultural productivity is associated with higher unemployment.

Parthasarathy examined the relationship between statewise growth rates of agricultural production per annum (from Yechuri's paper [25] and rates of unemployment, and found that "States with very high rates of growth of agriculture (exceeding 5 per cent) such as Punjab and Haryana do show very low rates of unemployment. But the scatter of the states with the same rates of growth among varying rates of unemployment does suggest that there is no firm inverse relationship between rate of growth of agriculture and level of rural unemployment" [16]. Bartsch also observes that "Any innovation, whether biological — chemical or mechanical reduces labour-hours of labour input per unit of output [5].

There may be a variety of factors responsible for the positive association between agricultural productivity (or growth) and unemployment. We have referred earlier to the inverse relationship between productivity and labour input. The inverse relationship would be accentuated if growth in output is achieved through labour-displacing technology and practices. But one would expect that the positive effect of growth of production and its forward and backward linkages on the rest of the economy would outpace the negative effect or rising productivity (output per acre of cropped area) on labour input. Or may be, agricultural prosperity acts as pull factor to attract labour from neighbouring areas and the enhanced employment potential due to growth is more than offset by a large number of claimants for work.

A paper by Alagh, Bhalla, and Bhaduri [2] throws some light on this phenomenon. In 100 districts — out of 281 districts for which data are presented — where the average rate of increase of output between 1962-65 and 1970-73 was 5.21 per cent per annum and where increase in the yield was the main contributing factor, the rate of increase in the male labour force engaged in agriculture[2] was 2.71 per cent per annum along with an increase in their productivity of 2.44 per cent per annum. At the other end, in 64 districts in which the initial (1962-65) yields per hectare were only slightly below the yields in the above 100 dis-

tricts, us to the conclusion that

If, in

[illegible] ment of village roads and rural sanitation system. All these schemes can form the core of the public works programmes or special employment schemes — with or without guarantee — for the landless.

While recognising the importance of the public works programmes and special employment schemes, a few cautionary remarks may be made. First, they must not become the main plank of employment programme and thus divert attention of the planners from the major task of rural development, namely, removal of all hurdles which impede the efforts of the poor and the unemployed to be self-reliant and earn their livelihood through their own work and merit. The planner's aim should be to integrate them within the mainstream of economic activity and not to segregate them into a footloose class of camp followers or retinues perpetually dependent on the benevolence of a government sponsored employment programme.

Second, all 'special' schemes and projects — EGS, SFDA, DIC, tiny sector, whoever their sponsors may be — must emerge as an outcome of an integral area plan, meaning they must shed their departmental/sectoral heritage. There is a world of difference between a minor irrigation project — even though duly tested for economic and technical feasibility — taken up under the compulsion of an employment guarantee scheme and the one which emerges as a result of a thorough review of resource inventory and development potential of the area, made by the District Planning Team. Even after several years of experience of EGS in Maharashtra, as late as November, 1978, it was noticed that "most of the works taken up under the EGS have been done in a haphazard manner without ensuring proper integration between them" and "though considerable number of percolation tanks are being taken up under EGS now, determined efforts to utilise the water impounded in these tanks have not been made". Hopefully, such deficiencies can be reduced, if not eliminated, through integrated area planning.

Third, the success of the special employment schemes should be judged by the progressive reduction in reliance on them. In other words, the aim should be to ensure that in due course the development of the area would be such, in quality and scale, that it would be able to provide income and employment to all its labour force, and fewer and fewer persons would find it necessary to register themselves as candidates for employment guarantee.

I must confess, there is a strong (and sound) body of academic opinion which favours giving pride of place to public works programme — or guaranteed employment — in the employment policy. Partly, this is an outcome of disappointment with post-Independence experience of the feeble impact of the varied development programmes including those specially meant for the benefit of weaker sections on the magnitude and intensity of poverty and unemployment. But more importantly, in some regions the resource base and potential are so meagre that even with the best of planning intentions and skills, it may not be possible to provide gainful employment to the swelling labour force within the mainstream of development. In such cases a purposeful — and preferably permanent — shifting of population may be unavoidable, and this can be best achieved through a well-planned public works programme aimed at capital formation. While we concede the force of this argument, we would once again submit that the public works programme should not become a *soft* option and an alibi for basic structural and institution reforms which constitute a basic condition for employment-oriented development.

Notes

[This is a revised version of the author's Presidential Address delivered at the All-India Labour Economics Conference held at Ahmedabad in December 1978. The author is grateful to Pravin Visaria, D R Sundaram and other friends for their valuable comments on the earlier draft.]

1 See, for example, Proceedings of the Technical Seminar: Labour Absorption in Indian Agriculture, sponsored by Asian Employment Programme of ILO (ARTEP) and Institute of Economic Growth, Delhi, January 22-23, 1979 (mimeo) and Preface by K N Raj to ARTEP publication cited in [4].

2 Actually, the number of male agricultural workers as given in the population Census 1961 and 1971, unadjusted for definitional changes.

3 Alagh's "effective employment" concept is different from the Draft Plan's adjusted standard person-years of employment due to the introduction of an income criterion.

4 A one per cent increase in percentage of farms below 2 hectares would lead to 0.31 to 0.49 per cent increase in employment in person-days per hectare. See Lakdawala [12].

5 It is worth noting that between 1960-61 and 1976-77, the value of production of Khadi increased from Rs 14.2 crores to Rs 55 crores but during the same period full time and part time employment in its production declined respectively from 2.06 lakh to 1.40 lakh persons and from 15.06 to 8.83 lakh persons. In village industries, while production in the same period increased from Rs 33.2 crores to Rs 131 crores, part time employment increased from 4.46 to 9.87 lakh persons and full-time employment only by 0.76 lakh persons, from 1.18 to 1.94 lakh persons. Agricultural Economy:

Threat of Ecological Disaster

Sri Madhava Ashish

This paper sets out to demonstrate how the present practices of agriculture in the Kumaon Himalayas is unavoidably implicated in giving rise to deforestation over extensive mountain tracts. If traditional farming and grazing practices are allowed to continue in the Kumaon tracts, not only will the hill populations destroy the hill environment on which their own livelihood depends and be forced to migrate to the plains, but the damage caused to plains agriculture by alternating floods and droughts, silting, and possible climatic changes will endanger the livelihood of the whole nation.

INTRODUCTION

THE unprecedented floods last year were an awesome reminder — if one were needed — that the destinies of people living in the North Indian plains are crucially affected by deforestation and deteriorating mountain environments in the Himalayan foothills. Deforestation in the hills is, in turn, the direct outcome of a certain complex of agricultural and animal husbandry practices which were relatively harmless in the context of low population density, but are proving to be highly destructive of the environment in the context of high and rising population density. The stunning realisation is beginning to dawn on a hard-hit people that what we have taken to be natural catastrophes or Acts of God are in fact the cumulative consequences of destructive and unsustainable patterns of human livelihood. Eco-catastrophes and environmental disasters turn out to have been largely caused by untenable economic practices.

This paper sets out to demonstrate how the agricultural economy of one particular hill region — the Kumaon Himalayas — is unavoidably implicated in giving rise to deforestation over extensive mountain tracts. If traditional farming and grazing practices are allowed to continue, not only will the hill populations destroy the hill environment on which their own livelihood depends and be forced to migrate to the plains, but the damage caused to plains agriculture by alternating floods and droughts, silting, and possible climatic changes will endanger the livelihood of the whole nation.

It is essential that policies and programmes be developed to stop this process before conditions in the Himalayan foot-hills reach the point of no return.

The argument can be briefly summarised as follows:

The inability of available cultivable land in the hills to produce enough food for a rapidly increasing hill population is giving rise to intense pressure on forest lands. Large forest tracts have been cleared of their protective vegetal cover over the years in a desperate scramble for more cultivable land, however poor in productivity. In spite of this, the region remains a net importer of foodgrains from the plains to the tune of almost 75 per cent of its annual subsistence requirements. But even more than this unwise extension of uneconomic agriculture, perhaps the single most important factor responsible for depriving the hills of their natural tree-cover is the extensive over-grazing of forests and grasslands by too many cattle and goats. The dung of these animals is absolutely essential for manuring the fields which generally have such poor soils that nothing will grow on them without substantial inputs of animal dung. But in turn they graze to the ground all available fodder and young foliage within reach, and so inhibit the natural regeneration of forest trees and grasses.

In the Kumaon region, at least, trees are felled for firewood only for the use of town-dwellers. Branches and waste from other operations are usually sufficient for village needs. Nor does the main cause of deforestation lie, as is popularly supposed, in commercial exploitation of forests for timber. The primary cause of deforestation is heavy over-grazing, which severely hampers the regeneration of forests after felling. (This, however, should not be construed to mean that bad forestry practices such as monoculture, clear felling and careless logging methods do not require urgent correction.)

It is the prevailing system of hill agriculture which is thus causing an interlocking set of problems which are playing havoc with the forest-based ecology of the hills. It can be further shown that in any realistic reckoning, there are certain basic constraints because of which there is no possibility of a long term development of the hill economy along agricultural lines. The analysis itself suggests the solution: the only real hope lies in an extraordinary and unprecedented programme to convert the uneconomic and environmentally destructive agricultural economy of the hills into a potentially far more prosperous and ecologically viable economy based on horticulture, perennial crops, and forestry.

It must be made clear at the outset that while this argument is basically correct, such figures as are given may not be equally applicable to all hill areas. The general picture presented here would still remain valid in its essentials, and capable of extension, with due modifications, to many other parts of the Himalayan belt. The purpose of this paper is to present a preliminary analysis of the problem which can serve as a starting point for further discussion and investigation in an area of critical importance. A great deal of detailed quantitative data will be required before corrective policies and programmes can be formulated. It is hoped that this preliminary statement will serve to draw attention to the need for more systematic surveys, and to show the factors which must be taken into account in formulating corrective policies and programmes.

THE PROBLEM

The people of the Kumaon are rapidly bringing their environment to the point of ecological collapse. With the increase in population over the years, forests were felled to accommodate larger cultivated areas, and new villages were established, usually at higher altitudes. The older and larger villages lay in the valleys where the soil was rich, the terraces wide, and water channels irrigated three full

crops in the year. (These irrigated valley areas comprise no more than 10 per cent of the total hill area and are excluded from the purview of this paper.) 1,000 to 1,500 feet above lay another line of villages, smaller, poorer, with narrower terraces, and with only mountain springs for water. Above them again came another line of dwellings, poorer still, having perhaps three crops in two years; many of them established as villages within living memory. This is the last line of villages at 6,500 to 7,000 feet altitude. When the population lower down increased to the point where the harvest yields no longer supported it, families migrated to start cultivation higher up, clearing more forests in the process. The prevailing picture today clearly spells population increase to the limit of available land.

An essential feature of hill agriculture is its absolute dependence on animal dung as manure. Hill soils are so light, shallow and low in humus content that without application of manure no rain-fed crops will grow. Light doses of nitrogenous artificial fertiliser can supplement manure on rain-fed terraces, but it cannot substitute for the moisture retaining qualities of dung and humus. In fact, experience indicates that the use of chemical fertiliser by itself, without manure, may be positively harmful on hill soils. Thus, the primary reason why hill farmers keep cattle is not, as popularly supposed, for milk, but to provide manure for the fields. These animals are gazed on common pastures and forests during the day and hence only their night dung can be collected. Maintained in this fashion, cows require minimal attention as compared with stall-fed animals. Stall-feeding of cows is rare, because poor milk returns seldom justify the labour involved.

In order to maintain crop yields, each farmer would ideally like to keep about four animals per acre of cultivation. Though there are variations between altitude belts, hill pastures are commonly so poor that each mature animal would require some 15 to 20 acres of mixed pastures and fodder forests to support it in good health and to allow continuous grazing without causing deterioration of pastures. Therefore, under existing methods of grazing, each acre of cultivation ideally requires some 50 acres of mixed pasture to support it.

When the population was small in relation to the land area, this proportion originally existed. But, as extension of agriculture progressed, the proportion between cultivated area, on the one hand, and pasture and forests, on the other, reached the point where pastures could not sustain the number of animals required to maintain the level of agricultural returns. If we say that a hill family of four requires 1,000 kgs of grain to feed it properly for one year, and that the average yield of rain-fed terraces is 300 kgs per acre in one crop and 200 kgs in the second, then each such family requires two acres of land to feed itself, and a minimum of half an acre for a cash crop. In order to produce even at such low levels on hill soils, the dung of at least one stall-fed buffalo, two grazing bullocks and two grazing cows is necessary. The poverty of hill pastures is such that each mature animal needs (but never gets) about 15 to 20 acres grazing area. In addition, each family requires an area of forest capable of supplying 75 to 100 oak trees for plough replacements if forests are not to be reduced by the demand. Building timber is a further requirement. While all these figures are subject to dispute because local conditions vary enormously from area to area and from altitued belt to altitude belt, we shall not be far out if we say that each family of four ideally requires 100 acres of mixed pasture and forest land to support itself even at the lowest subsistence levels without causing environmental deterioration. Such conditions disappeared more than a hundred years ago.

1970 figures for a sample of five villages show a total of 374 buffaloes, 388 cows, 442 bullocks, and 577 goats, totalling 1781 animals for a human population of 1342. While the desirable load on pastures under existing methods of grazing is something like 15 to 20 acres per head of cattle, estimates for the actual present load on pastures vary between 0.8 acres to 1.5 acres per head of cattle. Figures supplied by the UP Forest Department show that out of a total forest area of 27,000 sq kms in the Kumaon, about 20,000 sq kms are actually available for grazing by about 4 million cattle. This huge number of half-starved and stunted cattle gives a pasture loading at least ten times greater than what hill pastures can sustain without deterioration. Where there are concentrations of population, the loading would be much higher.

The outcome, in consequence, may be readily envisaged. Population increase together with restrictions on agricultural extension have resulted in the fragmentation of land-holdings into such tiny plots that very few families today obtain more than two or three months' food from their fields. For the families to survive, the working members have to find other employment. And since there are few opportunities for employment in the hills, it has to be found in the plains. However, for the most part only the men migrate, leaving their families and their cattle in the hills. So large is the number of men in outside employment that, if the families were to accompany their menfolk, the hills would be almost empty. The residents are mostly women, children, and old men. Only a small portion of men of working age finds local employment in the forests, on roads, or on the local staff of government agencies. The number of families resident in the hills has thus continued to increase, while the per capita land-holding and the per capita share in the harvest continued to decrease. The number of animals maintained has also continued to increase with the number of families, at an estimated rate of 2 per cent per annum.

At the same time, a natural economic phenomenon has occurred which masks the poverty of the hills and creates a deceptive illusion of prosperity. Hill men in service in the plains send their earnings home. From a small trickle in the 1940s, the money flowing into the hills became a flood by the late 1960s, inundating the villages with ready cash. Families with a husband and a couple of sons in service had never known it better. With the help of what has come to be known as a 'money order economy', the supply of plains-earned money and plains-grown grain has permitted the resident population to continue their traditional farming practices, while their numbers have been steadily rising above the maximum sustainable by the environment. Had the Kumaon been an isolated state, such an escape from environmental compulsions would not have been so readily possible. The natural consequences of over-exploitation of the environment would have, in the long run, pinned down population density at a level where the recuperative

capacity of the environment balanced the amount of exploitation. But because of the possibility of migration and the resulting inflow of cash, there are no forces inherent in the situation today to jolt local people into an awareness of what is happening.

However, none of this money has reduced the environmental burden on the hills. On the contrary, with money to pay for casual labour, agricultural extension is being pushed to the limits. More animals are being bought and new homes requiring timber are being built. Forests which were unbroken canopies of green till two decades ago are now ghost forests of grey poles with a few tufts of leaves. Natural regeneration of forests is being prevented by the grazing and trampling of too many animals. In what is now a competitive scramble to collect fodder leaves which may be fetched from a distance of several miles, hill women are hacking off large branches with a heavy cutting tool (*bariyat*, where they previously used a light sickle to remove only leaf-bearing twigs. Such heavy cutting badly damages trees and greatly reduces the crops of both green leaves for fodder and dry leaves for the animals' bedding, all of which eventually goes into the fields as manure. Deprived of its litter, the forest floor erodes down to the tree roots. There are areas of Oak forest where each tree stands on a hillock formed by its own roots, the surrounding soil having been washed away.

The pressure on pastures is now greater than ever. Heavy over-grazing, and over-cutting of fodder trees have also resulted in a degeneration of the cattle and reduction in milk yields. Existing programmes for cross-breeding cattle with high-yielding exotic strains have tended to fail for the same reason. In fact, exotic strains often do even worse under existing cattle management methods than the unproductive but hardy locals. Continuously grazed pastures produce only 1/4 of the quantity of grass produced when pastures are under controlled grazing or hand-cutting, for the reason that the beneficial effects of photosynthesis begin only after the blades of grass are over six inches high, and with uncontrolled continuous grazing the plants never reach this height. And because cattle graze selectively, the most succulent and nutritious grasses suffer the most and so give way to coarser and poorer grasses. Continuous grazing thus has the further effect of driving the better quality grasses out of existence.

In other words, even in order to maintain itself at its present meagre level, hill agriculture is drawing on the capital resources of the natural environment at a greater rate than they can replenish themselves. For this reason hill agriculture is uneconomic, besides providing much less than subsistence for the land-holders. If we regard pasture and forests as the natural capital resources of hill agriculture, the yield therefrom in terms of grass, fodder, leaves, and humus can be considered their yearly interest. Over-grazing and over-cutting of leaves mean that farmers are not only spending their annual interest but are also eating into their non-replaceable capital resources. This is the highway to economic and environmental bankruptcy.

Environmental Destruction

The geological formation of the Kumaon hills is such that they are extremely vulnerable to dessication and erosion. The soil is unstable, the gradients are steep, and the monsoon rainfall is high (Nainital, 108"). Damage to forests and grass-cover therefore represents a major threat to soil stability. The biggest contribution to environmental destruction is made by free-grazing bullocks, cows and goats, helped out by the demand on fodder forests. Instead of carrying one animal per 20 acres, pastures and fodder forests together are actually carrying about one animal per 1.5 acres or less. Cattle scramble over steep hillsides in search of food, cutting the soil with their hooves, trampling down tree seedlings, and leaving grassfree tracks down which monsoon rain washes the loosened soil.

Once the subsoil rock is exposed, re-establishment of vegetative cover is difficult, if not impossible. Water retention being lost, the run-off is unchecked. This threat is increasing exponentially, for each new area of cultivation reduces available pasture, and each new family unit, formed when brothers of a new generation divide their land, commonly maintains its own cattle, thus increasing the demand on decreasing pastures. Rain on bare hillsides is carrying off subsoil, spreading sterile detritus on the fertile plains, silting dams and choking canals and river beds. Heavy rains run quickly off the hills that retain no moisture, causing increasingly severe floods, but in dry weather the rivers and springs are tending to run dry.

Everyone has now heard that deforestation affects the climate. Not everyone appreciates, however, that average rainfall figures are not in themselves a sure guide to climatic change. What matters to vegetation — and so to the farmer — is not so much the amount of rain as its dispersal over the plants growth period and the number of consecutive dry days. Though deforestation may reduce the average rainfall, the effective reduction is greater when, in the pattern associated with deforestation, rain comes in heavy downpours with dry periods between storms. And when this pattern is further associated with reduction in the water-holding capacity of the soil due to inadequate humus content, the effects of climatic change on agriculture and environment are further aggravated. Such climatic changes may take place so slowly that our awareness of their onset is inhibited by the normal alternations of good and bad years. Imperceptibly, an environment like the Kumaon hills may reach a critical state in which virtually irrecoverable erosion or dessication could be triggered off by a period of excessive rainfall or prolonged drought. The total effect would be to threaten the agriculture of the north Indian plains, because the pattern of the Indian monsoon and the release of its waters for the rest of the year is controlled by the condition of soil and vegetative cover in the Himalayan mountain belt.

In the context of such predictable devastation, the conclusion is inescapable that nothing can check the accelerating decline in the hill eco-system without drastically curtailing the farmers' suicidal exploitation of their irreplaceable natural resources.

Why Piecemeal Reforms Will Not Work

It might be thought that an order prohibiting the grazing of cattle (disregarding for the moment the virtual impossibility of enforcing such a ban) would solve the problem at one stroke. Cattle would be stall-fed, forests would regenerate quickly, and grasslands would produce four to six times the bulk of grass previously grazed. Because both day-time and night-time dung would be collected, the manure available for fields would double.

However attractive this may appear at first sight, the suggestion is un-

workable. Against these advantages we have to consider that the fodder demands of the existing numbers of cattle (stall-fed buffaloes and night fodder for cows) have already resulted in approaching destruction of existing fodder forests, and that it takes a woman the best part of half a day to keep the buffalo fed. Who is going to cut grass for the two bullocks, two cows and their calves? The men cannot do it, for they are at work the year round to earn food for the family. We may immediately think in terms of reducing the number of cattle by half, still keeping the manure yield at its present level. Even then, the work load of the women would still be too high, and we run up against the difficult problem of disposal of surplus animals.

The problem ramifies. In order to give the hill women an incentive to undertake the extra labour of hand-cutting grass and fodder leaves, the present low-yielding buffaloes and cows would need to be replaced by a smaller number of high-yielding animals whose cash returns would economically compensate for the extra work. But to obtain such economic returns, concentrates are necessary — and the national export policy on oil cake has raised prices beyond the reach of the below-subsistence farmer. Also, these cross-bred high-yielding cows produce humpless bullocks. No steps have been taken to popularise a yoke by which they can be utilised for draught, so they are sold for the production of vaccine and the farmer keeps his old local breeds going to ensure a supply of humped bullocks for ploughing. Thus the cross breeding programme instead of reducing the number of animals has increased them.

Furthermore, unlike in the plains where bullocks work the year round, the hill bullock may work as little as 12 days in the year. A hill farmer with as little as one acre of land keeps his own bullocks in order to make sure of getting his ploughing done at the best time. In economic terms, therefore, the hill bullock is an almost total liability. Just prior to and during the short ploughing seasons he feeds his bullocks. For the rest of the year thousands of idle bullocks trample the over-grazed pastures. With one or two rare exceptions, the gradients of village lands and of local roads are all too steep for bullock carts. Their use for lift irrigation is unknown, and even threshing of the tiny harvests is done by hand. Can one rationally expect the hill women to break their backs feeding these all but useless animals at stall?

There are those who maintain that with irrigation and fertilisers, wheat yields in the hills can be raised from an average of around 10 quintals per hectare to a regular 35 quintals or more. The basic objection to this is, of course, that increased yields from the fields will in itself do nothing to diminish the destructive effects of over-grazing and over-cutting. Moreover, water resources for expensive small-scale irrigation are limited and produce, in effect, a few oases of greenery in an otherwise arid land.

A cruel blow lies hidden in the benevolent government plan for a fruit belt. Plans for promoting horticulture in the hills have a long history, going back to pre-independence days. The problem which none of these plans could overcome was that cultivators would be deprived of crops for several years between planting fruit trees and their economical fruiting. This problem was thought to have been solved by a recent government scheme to prepare small orchards on fresh land and to hand them over to farmers when they reached fruit-bearing age. But there is no such fresh land. Almost every square inch of land not under cultivation is already more than fully grazed. By felling forests and enclosing village pastures for the fruit-belt orchards, the remaining pastures and forests are brought under even heavier grazing, thus hastening the day when the grass roots will be washed away. The expropriation of large areas of forests and grasslands for conversion to orchards would do nothing to reduce the cultivated area, while at the same time reducing village pastures by an equal amount, thus exacerbating the effects of over-grazing. In any event, only a tiny percentage of the population could be settled on such orchards.

To those who recommend the establishment of industries in the hills, it may be pointed out that this would only exacerbate the basic problem by holding even more men in residence in the hills.

What Is the Solution?

These and other interlocking problems have brought hill agriculture to its present state of small, uneconomical holdings, steadily eating away the natural resources on which they depend and, even so, producing an average of but two to three months' foodgrains in the year for the resident population.

The fact is that so long as we attempt to solve the hill problem in terms of agriculture, we find ourselves blocked at every turn, for the reason that we are fifty to a hundred years beyond the time when, however poor it was, there was a viable agrarian economy in the hills. Since the hill forests are already badly damaged, mere palliatives having the effect of freezing the *status-quo* will not touch the basic problem. The conclusion to be drawn from the facts recited is that the area of cultivation needs to be reduced to a point where the relationship between cultivated area, cattle numbers required to support such cultivation, and pasture-cum-forest required to support the cattle, stand in such proportion that the demand on pasture and forest is less than their regenerative capacity.

If forests and pastures are to be allowed to regenerate, a reduction in cattle numbers is essential; and if cattle numbers are to be drastically reduced, the amount of land under cultivation of foodgrains would have to undergo a proportionate curtailment. The area of hill pasture cannot be increased, for they constitute almost every inch of the hills, including government forests and fallow lands. Since the total area is being over-grazed, and over-grazing is the major factor contributing to loss of vegetal cover and environmental devastation, either agricultural practices must be reformed in such a manner that grazing can be stopped, or grain agriculture must be stopped altogether. Since pasture areas cannot be increased, and we have to assume that cultivated area cannot be decreased, we are left with two variables: the numbers of cattle and the types of crops. Since the numbers of cattle, and particularly the numbers of bullocks, are related to the types of crops and the amount of ploughing required for each crop, it is apparent that the substitution of perennial or hand-cultivated crops in place of the traditional foodgrains is the key to hill reform. In brief, therefore, the ultimate aim of hill reform should be to stop virtually all foodgrains cultivation, and to put all arable lands to such uses as do not require the plough: fruit orchards, tea, nuts, medicinal plants, castor, flowers, vegetables. With stoppage of foodgrains cultivation in the hills (except in the fertile irrigated valleys)

the need to keep animals only for their manure would be eliminated. Once the plough is banned, the large-scale felling of oak trees for replacements of the wooden plough-share would automatically stop. With no further need for drought animals, bullocks which outnumber cows and do immense damage through uncontrolled grazing, would no longer be needed. Prohibition of grazing could then be realistically implemented, and the low-yielding hill cows replaced by a breed capable of giving an economic milk yield on stall-fed fodders. Two advantages would immediately result from stall feeding of all remaining animals: the same quantity of manure would be obtained from half the number of animals, and ungrazed pastures would produce four or more times the quantity of grass for hand-cutting. Thus, with half the number of animals and four times the quantity of grass, the effective loading on pastures would reduce from one animal per 1.5 acres to one animal per 10 or more acres in terms of uncontrolled grazing. Or, to put it another way, by reducing the number of animals by half and stall-feeding them, eight times the present ration of grass would become available to each animal. It is well to bear in mind that since bullocks outnumber cows, and since no farmer is willing to do without his bullocks even though they are needed for only 15 days' ploughing, the actual halving of cattle population and stall-feeding the remainder will not happen until the plough is abolished from the hills, and bullocks are therefore no longer needed for draught.

With foodgrains cultivation and uncontrolled cattle-grazing stopped the hills would be freed for the development of forestry. Large areas of bare land would become available for afforestation, even after allowing plentiful space for village requirements of hand-cut fodder grass. Since the all-important water retaining capacity of the hills is even more closely related to the extent and condition of the forest floor than it is to grass cover, erosion would be stopped, and the ecological balance restored. Forest revenue would increase to several times its present amount, and a far greater number of hillmen would find whole-time employment in forest work than presently find employment in the hills. Although reafforestation might take anything upto 50 years to complete, the Kumaon would soon become a huge tourist recreation area of almost unparalleled scenic grandeur.

Under more ordinary circumstances, a proposal to stop foodgrains agriculture in the Kumaon — and extending the argument, elsewhere along the Himalayan foot-hills — might appear extravagant. But these are not ordinary circumstances. The agrarian economy of the hills has already collapsed, and if the hill environment is not already in a critical condition, it is certainly approaching it. Whether it will go in 20 years, as the author has heard foreign 'experts' predict, or in 50 to 100 years, as appears nearer the truth, the nation cannot afford to wait and see if the Kumaon will reach the point of no return. The welfare of all the people of India is conditional upon the welfare of the Himalayan foot-hills, because no part of India can afford to ignore what happens to the agricultural economy of the North Indian plains.

We have to return to the point that the hill population is, on the average, producing two to three month's foodgrains from their agricultural operations. Foodgrain for the remaining nine to ten months is already being imported from the plains, and families are actually subsisting on money earned in non-agricultural pursuits. If, as is now the case, India is producing a sufficient surplus of food to feed the hill population for nine to ten months, can it not feed the hill population for twelve months? If so, then the entire maze of interlocking problems can be brushed aside because hill agriculture ceases to have any national significance comparable to the threat posed by the degenerating environment in the hills.

A new set of problems will immediately arise and will have to be solved; but at least their solution will not be blocked in the manner that the agricultural problem is blocked when attempts are made to solve it on its own level. In the long run, the cost to the nation of subsidising the hill population during the transition to an economy based on forestry and horticulture to the extent of two to three months' foodgrains would be immeasurably less than the overall gains from establishing an economically and environmentally more viable situation in the Himalayan foothills.

Corrective Measures

A total re-structuring of the hill economy is being envisaged. The ultimate aim, as already stated, is to eliminate grazing by abolishing the plough from the hills (excepting the irrigated valleys), and to bring virtually all land presently under cultivation or pasture under perennial or semi-perennial vegetal cover. This would include afforestation of some land hitherto cultivated or grazed, and the utilisation of arable land for uses which do not require the plough, such as fruit-orchards, nuts, tea, medicinal plants, flowers and vegetables. In this connection it may be noted that ecologists recommend complete afforestation of all lands above 4,000 feet altitude.

Extreme administrative action, such as prohibition of grazing and confiscation of bullocks and ploughs, even if this were to be backed by large-scale compensation and aid in establishing new cropping patterns with their associated infrastructures and sales outlets, would be both humanly undesirable and difficult to enforce with justice. It would appear to be more appropriate to begin by introducing elements of reform which, while not in themselves changing the traditional life-style, tend to produce a social climate favourable to change. Later when the need to prohibit grazing arises, as it must, its impact may be felt only by that section of the community which has not voluntarily accepted the advantages of the innovations.

The policies and programmes required may be summarised here.

(1) The programme could be started in the higher altitude villages where the effects of deforestaiton and erosion are most damaging. These villages are usually the poorest, smallest and least heavily populated, and are therefore expected to provide the least resistance to change. As an immediate step all ridges and well-defined spurs where bare, should be afforested with suitable varieties of trees for a minimum of 50 metres on each side. Where existing cultivation stands on such ridges and spurs above 3,600 to 4,000 feet altitude, it would be advisable to assign other areas for cultivation and to afforest, or even to consider moving such villages to other locations.

(2) In the interests of conversion of existing arable land to orchards etc, further extension of agriculture should be prohibited and no new land grants should be given for orchards. This would be a relatively straight-

forward matter.

(3) The Consolidation of Landholdings Act, which has not yet been implemented in the hills, must be enforced just as vigorously as it has been in the plains, notwithstanding the difficulties on account of the wide variability of hill soils from place to place. The fragmentation and scattering of landholdings militates against the development of initiative and the introduction of innovations by individual farmers. No individual farmer can, by himself, change his cropping pattern, change from agriculture to horticulture, or from grain to fodder crops. His tiny, fragmented holdings are scattered over several hillsides with no space-wasting bunds to mark the division between his land and his neighbour's. He must plant exactly what his neighbours plant, for anything different would be destroyed by his neighbour's bullocks when he ploughed or turned his animals onto his fallow. If landholdings are consolidated, individual farmers are free to change their cropping pattern at their own wish and are therefore open to progressive proposals. If the village lands stay as they are, then no change can be brought about without obtaining the unanimous consent of every landholder in the village. And since village lands are often owned by residents in several other villages, decisions involving the land of one village become the concern of people in many villages. The difficulties in obtaining unanimous agreement would therefore be practically insuperable. It is therefore considered that application of the Consolidation of Landholdings Act in the hills is a pre-requisite to any sort of reform of land use.

(4) Some of the land under cultivation, particularly at higher altitudes, is of such poor quality and on such steep gradients that forestry is its only proper use. At the time of consolidation of landholdings, the opportunity should be offered to landholders to surrender their land to the government for afforestation against adequate compensation, or a scheme could be worked out whereby land would be leased to the forest department for a rent which would be at least equivalent to yearly crop values from its agricultural use Where such land is available in sufficiently large areas to make a sizeable block, the purpose of increasing the forest area by afforestation of arable land would be achieved more cheaply than if full compensation were to be given for outright acquisition of land.

(5) While total prohibition of grazing must eventually be imposed if the hills are to be saved, this cannot be done as an initial measure since the resentment aroused and the consequent difficulty of enforcement would arrest the programme before it was started. As an introductory step it should be possible to impose a grazing tax on all animals taken to pasture, rates being made higher for low-yielding cows. Rates could be subject to revision as breeds improved. Stall-fed animals should not be taxed, the intention being to discourage grazing and to encourage stall-feeding. This could be expected to engender awareness of the relation between the costs of maintaining animals and the benefits they give, so placing a disincentive on keeping animals only for manure and an incentive on economically yielding animals. Evasion of tax could be expected, but even evasion increases village awareness of the issues at stake

(6) No solution to the hill problem is possible unless the number of grazing animals is drastically reduced A reduction in the number of cattle would require, in turn, an improvement in quality of the lesser number of animals. In order to achieve this, a crucial pre-requisite is the provision of a legal and easily workable channel for the disposal of useless and surplus animals. Once this is provided, a start could be made by offering one buffalo or middle-yielding cow in exchange for two or more local cattle. Male calves could be purchased at a nominal rate.

It is a sad and ridiculous fact that the Act preventing the destruction of useless cattle is the biggest obstacle to the solution of the hill problem. It would seem absurd that the fate of the Indian nation may hang upon such an irrational and out-moded sentiment It is particularly ridiculous when one knows that the great majority of hill farmers have no objection to selling cows destined for slaughter, provided that their destination is discretely concealed. The most important contribution the government could make towards solving the hill problem would be to provide a practicable channel for the disposal of unwanted cattle.

(7) Both to encourage stall-feeding and to provide more fodder to support programmes for the upgrading of cattle, it should be compulsory for every village to set aside sufficient grassland to furnish hand-cut grass for winter fodder. These areas should be fenced-in or walled. Some villages already have such grass farms, and they are highly valued. Similar provision should be made for replanting and protecting areas of fodder trees. Forest areas fenced by the forest department in the normal course of forest administration could become permanently fenced grass-cutting areas allotted to neighbouring villages. Grass-cutting rights in such areas could be restricted to families actually stall-feeding improved cattle. Both cattle and forests would benefit.

(8) It is generally accepted that goats and forests cannot survive together Goats permit pine forests to grow, but they destroy the seedlings of broad-leaved trees and so contribute to the monoculture of pine, which is ecologically undesirable. Indeed, it is possible that it is goats, and not the policy of the forest department, which are responsible for the increasing pine monoculture of which so many complaints are being made. Hill goats are not milked but are kept almost entirely for sale to town butchers. They are popular because they are little trouble to keep, require no night fodder, and, though there is little of it, their manure is rich. While they add considerably to their owner's income, their contribution to village diet is minimal. Any government with a will to save the hill forests, preserve the hill environment, and benefit the hill population, would ban the keeping of goats entirely. Chickens could substitute for both income and diet, and would harm nothing

(9) Much could be done to encourage stall-feeding and so to reduce pressure on pastures if cheap fodder could be imported from the plains by subsidised transport. Such fodder might be the treated and pelleted crop-residues for which the UP Agricultural University is said to be erecting a pilot-plant at Pantnagar.

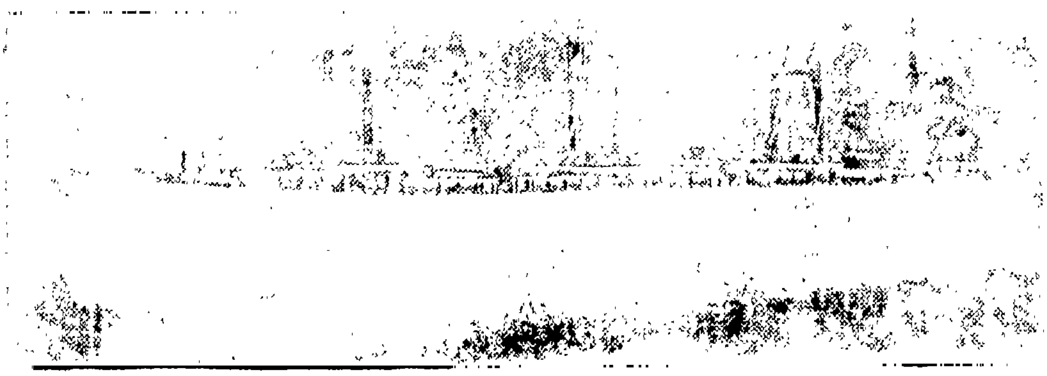
(10) One of the greatest incentives to change would be the introduction of cottage industries. A current programme teaches women to spin wool on the Bageswar Charkha, and they are said to be able to earn six rupees per day. Such alternative occupations for women are important, for it is only lack of alternatives that causes hill women to labour all day on uneconomical landholdings and uneconomical cattle without counting the cost in

cash equivalent.

(11) No ordinary village farmer will even consider a proposal to stop growing grain unless he is given grounds for confidence in the ready availability of market grain. Mere assurances will mean nothing to him. Grain must be visibly available at all times, and available within easy reach. This means that the distribution system must be vastly more efficient than at present. Storage warehouses must be built in the hills and kept stocked so that supplies do not vanish within a few days of major road breaks which are common during the monsoons. A fairer and more convenient placing of grain distribution points should be a major factor in planning village roads. It appears that most major road construction in the hills has been either for strategic purposes or for the exploitation of forest and mineral resources. The village economy has benefited by accident. If a major reform of hill village life is to be brought about, it is necessary that minor feeder roads be built to link village areas to the main highways.

(12) Some form of subsidy would be required to support the farmers during the transition from grain-farming to the time of obtaining economic returns from the proposed new crops not requiring the plough. In the case of orchards, several years elapse between the planting of trees and their economical fruiting. In the case of other new crops too, subsidies and/or a support price for the products need to be guaranteed. The quantum of subsidy should be equal to the value of grain lost to the grower, which could even be supplied in the form of free-issue rations.

(13) Although the aim of the programme is to dispense with draught animals (bullocks), and so to dispense with ploughs and yokes, many years will pass before the programme begins to take effect. It is therefore desirable to provide an acceptable iron substitute for the customary wooden ploughshare. Hill farmers continue to fell thousands of mature oak trees, each farmer requiring 4 or more wooden shares which the stony soil wears out each year. The requirement is roughly one tree per farmer per year. If an acceptable iron substitute could be designed, the felling of oak and other hardwoods for ploughshares may be reduced during the interim period. Similarly, the introduction of a yoke designed for humpless bullocks bred from exotic high yielding strains would help to reduce the total number of animals presently maintained by making it unnecessary to retain the ... for draught.



The task of implementing such a programme might at first sight appear enormous. Since many different government departments would be involved, it is essential that their programmes be co-ordinated by a single authority with its headquarters in the Kumaon, and with powers to control and co-ordinate every aspect of the programme. If such an authority is established, private citizens representing different interests must be represented.

A detailed ground survey is required in order to define more closely the problems to be tackled and to estimate the funds required. Much research into alternative uses of agricultural land has already been done, and this needs to be collated and investigated. Field-trials need to be undertaken under conditions which relate to actual village situations. The financial outlay involved may seem forbidding, but the cost to the nation would, in the long run, be for less than the penalties of allowing present trends to continue unchecked. Let it not be forgotten that the abuse of environment which we are up against cannot be treated as grossly selfish exploitation and stopped summarily by law. The hill people, and particularly their women, are uneducated peasants caught in the toils of a traditional life-style which they do not know how to change. Psychologically, perhaps the biggest obstacle consists of the fact that the hill man persists in regarding himself as a foodgrains cultivator. Because the proposed corrective measures will inevitably interfere with the traditional life-style and ...

Before introducing such corrective measures, a mass education programme is therefore absolutely essential. Hill village people are aware that the land is not supporting them, but they do not have a grasp of the total situation, nor can they envisage any viable alternative to their present uses of the land. Government sponsored schemes for the improvement of the hills have come and gone by the dozen with little or no effect. In fact, hill men have learned to regard all such proposals with cynical distrust.

This is why an imaginatively planned education programme is essential. It is necessary to engender awareness of their predicament in the minds of the hill people and to give them an understanding of the causes. Before threatening their emotional security, which is linked to their life-style, they must be made to see that their traditional life-style is itself insecure. In so far as this is possible, they need to be persuaded to ask for the very reforms they most need to have. They have to be shown the precipitous danger they are approaching. To offer or to enforce change before the need for it is generally felt would result in their clinging even more firmly to their traditions.

All this will not be easy. But to balk at the task is to march towards predictable self-destruction. The facts recounted here are grimly real. The solution suggested here may be modified on the basis of more and better facts. What we cannot do is to continue to turn a blind eye to a rapidly deteriorating situation.

Masterpieces inspired by Indian Dyes

MADHUBANI

Paintings in the characteristic Madhubani style are today much sought after all over the world Loose-limbed, exaggeratedly vertical figures, almost naively drawn, but nevertheless with a reserve of strength in their forms, dominate the compositions Foliage and flower are stylized and elaborated into extended decorative patterns

In Madhuban and its neighbouring villages in the southeast of India, this style of painting was used traditionally for murals on the outside of huts. Today the designs are being adapted on fabric and paper

The Madhubani murals were executed only by women who obtained all the colours used from natural sources Sensuous scarlet and deep sienna from the Kusum blossom bright yellow from turmeric soft gold from a compound of banana leaf juice, milk and lime, rich black from encaptured smoke these were then mixed with goat s milk and Bakul tree gum as binding media

Indian dyes have come a long way since then

Today Atul Products produces a wide range of Synthetic Dyes which help colour everything from fabrics of cotton, jute, wool, art-silk, and man-made fibre, to leather and paper.

Atul also produces Dye Intermediates to help make Synthetic Dyes, and Optical Whitening Agents which make whites look whiter.

Wherever there is colour, there is a dye Atul makes some of the finest man-made dyes.

C[illegible] is Nove[illegible]

ADDRESSING a press conference 'chaired' by the Minister for Information and Broadcasting on June 25 (the fourth anniversary of the declaration of Emergency), Morarji Desai said that some kind of preventive detention law was in the offing and that government was considering whether it could bring forward such a legislation and get it passed. Not to be left behind, the Union Home Minister, while addressing another press conference on the same day on the continuing agitation by Central police personnel all over the country which, according to him, was being instigated by "certain elements", threatened that in view of the widespread unrest in the country, some kind of a preventive detention law was necessary.

These sentiments were forthcoming, coincidently, barely days after the Central government had formally issued the Presidential notification enforcing the provisions of the Constitution (44th Amendment) Act, 1978, which sought to undo some of the changes introduced by earlier constitutional amendments (39th and 42nd) curtailing democratic functioning and supremacy of the law. Perhaps it was equally fortuitous that the said Presidential notification, while announcing the various stages over which the provisions of the 44th amendment would come into force, carefully omitted setting any date for the coming into effect of those provisions which promised protection against arbitrary arrest and detention. Actually, since government, while piloting the 45th (later 44th) Constitution Amendment Bill, did not agree to strong demands that the provisions in the Constitution permitting the enactment of a law providing for preventive detention be so limited as to be made available only in the event of a declaration of a state of emergency, government is even now entirely within its power to promulgate an ordinance and bring preventive detention back in action; and since once an ordinance is promulgated, there would be a qualitative change in the situation, a proper preventive detention law is well within the realm of possibility.

That the Janata leaders, most of whom were themselves victims of preventive detention laws during Emergency, should actually be contemplating to bring them back, is not in the least surprising. In fact, the Janata leaders were most tardy about repealing MISA, which was finally accomplished more than a year after the Janata party assumed power at the Centre. In the meantime, government had even attempted, unsuccessfully, to incorporate the provision for preventive detention into the Indian penal code itself. Since the formal repeal of MISA in July last, senior Janata leaders, particularly the Prime Minister, the Home Minister and the Law Minister have several times given broad hints that they still considered it necessary for the government to arm itself with such "special powers" in order to be able to deal with "anti-social elements". Thus, when on September 30, 1978, the Union Law Minister was arguing that his ministry was considering a proposal to give such "special powers" to states to detain "anti-social elements for a limited period", he was merely echoing the sentiments expressed earlier in the week by the Prime Minister at the conference of chief ministers; the preventive detention law had to be repealed, Morarji Desai said, because of the popular resentment against its misuse during Emergency; but it would have to be brought back because "those who want to destroy democracy should not be allowed to exploit democratic safeguards to destroy democracy itself" — the very words that Indira Gandhi had used in her broadcast of June 26, 1975.

Against this background the Prime Minister's remarks on the anniversary of the declaration of Emergency acquire quite sinister significance. There is perhaps not much point in enumerating the general as well as specific failures of the Janata government during the last two years and more of its existence; but what is interesting is that even senior Janata leaders have begun to openly declare that the situation currently existing is very much reminiscent of the situation that prevailed before Emergency was clamped on the country in 1975. The latest and most striking manifestation of this crisis has been the countrywide police agitations to suppress which the government had to call in its own para-military forces; these, seeing in the course of suppressing the police agitations that the police had been given generous pay rises, in turn duly revolted; to suppress them the army has had to be called out; and the unasked question is whose aid the government would invoke should the army now make its own demands for bigger pay packets and revolt?

An easy answer would be to declare Emergency. But such a solution

only appears, superficially, to be easy; the problem for the Centre is that its present control over some of the crucial instruments of Emergency — the police and the army — is much less sure than that of the previous regime.

The revolt of the Central Reserve Police Force and Central Industrial Security Force has posed some quite peculiar problems for the government. After all, these forces were specifically created to be used against the people, and their deployment was carefully managed in such a way as to completely isolate them from the people of the region where they were deployed, to better ensure that they would be the most effective instruments of suppression. Under a very liberal interpretation of Article 257 of the Constitution, these forces were used again and again to intervene unilaterally in states where the administration was headed by a political combination different from the one prevailing at the Centre, and the Central Reserve Police Rules explicitly recognise that the "members of the Force may be employed in any part of the Indian Union for the restoration and maintenance of law and order, and for any *other purpose as [may be] directed by* the Central Government". Minority nationalities in the border regions have no cause to love the CRPF.

Now that this most dependable servitor of the Centre has itself been found to be not quite so reliable, and the government has had to ask the army (its last resort) to quell the revolt by the Central police forces, it is unlikely that even a declaration of Emergency in itself will ensure stability. Hence the fresh loud thinking on a detention law. For a detention law is the least troublesome way of tackling difficult problems, overcoming inconvenient opponents. The ruling party too seems to be more harassed by contradictions within itself than by enemies outside, even more than the Congress was in 1975, though the Congress leadership too took advantage of MISA to settle scores with opponents within the ranks.

On the face of it, however, there might be doubts about the Janata government's actual capacity to legislate and enact a new detention law since, obviously, large sections from within the ruling party would be opposed to such a measure. But such a reading fails to take into account the possibilities, in the 'realignment' that is presently being widely talked about; and a grand coalition comprising elements of the Congress from all the parties can certainly claim to be historically continuing the glorious Congress tradition by agreeing to the enactment of a detention law.

What the government needs is a credible excuse, and the revolt by the Central police forces, while no doubt extremely serious, still has not touched the day-to-day lives of the people in as dramatic a manner as even the hesitations of the more humble policemen in May and June did. It is rather difficult to pretend that the Republic is in mortal danger because some of the most repressive organs of the Republic have been in revolt — especially since that revolt has, to all appearances, been smothered. A more credible alibi for seeking to enact preventive detention legislation (one could begin, as earlier such legislations all began, with a simple ordinance to take care of immediate problems) would be large scale industrial strife, and the ensuing crisis in the railways over the question of bonus to railwaymen could well have its own uses.

Mizoram

Political Failure

THE apprehensions that the kind of crisis that overtook the Sailo government soon after it assumed office almost exactly a year ago (which led to that government's fall four months later) would once again overtake the *new government* formed once again under Sailo towards the end of April this year have come true; within weeks of its assumption of office, the Mizoram government is once again gripped by a serious crisis. As in the period immediately following the elections last year, when the Chief Minister tried to further consolidate himself by extending his hold over sections of the 'underground' and even managed, for a while, to create the impression that a major faction of the MNF was in revolt against the leadership of its founder, Laldenga, in the present instance too, the crisis bears close relation to the continuing interaction between that faction of the People's Conference which the chief minister heads and all other forces opposed to it. The chief minister has himself said that the present situation has been created by his political opponents who include the breakaway faction of the People's Conference, the Congress, and the Janata party. The chief minister would naturally want all political opposition to him to be tarred with the 'underground' brush.

The new political arrangements in Mizoram, after the lifting of the Emergency, could have been of a kind as to have included all political elements and, following the agreement reached by the MNF and the Janata government at the Centre, there were indeed hopes that the MNF would be accommodated in the new arrangements. These expectations have been belied.

The continuing instability and violence in Mizoram are only an expression of the deeper political failure of all the parties to the dispute especially of the Government of India which for long even refused to acknowledge that a dispute existed. To a lesser extent, the failure is also of the chief minister who has failed to come to terms with the rebel elements, or at least achieve some kind of a passive 'peaceful co-existence' with them — as has been done by the Nagaland administration under the leadership of the UDF. The Centre has also contributed its bit to the further alienation of the Mizo people, especially through its policies regarding Hindi, the cow, religious conversions, etc.

The serving of the 'Quit Mizoram' notice on non-Mizos, the murder of a non-Mizo official in Saitual and the widespread attacks against Mizo residents in Silchar that followed, have led to quite predictable response from the administration. The virulence of the retaliation in Silchar has certainly been a new phenomenon, and has to be seen in the context of the emergence of an altogether different kind of 'inward-looking' movements among the non-tribals in the northeast — be *they of the relatively more recent* chauvinists in Assam or of the older chauvinists in Bengal.

The situation, on the eve of the expiry of the 'Quit Mizoram' notice, is noticeably reminiscent of the one that prevailed before the outbreak of the MNF insurrection in 1966; and the violence that accompanied the brief lifting of the curfew in Aizwal on June 19, and the blanket permission given to the army authorities to 'shoot at sight' suggest that the government is, as always, of the view that the only way to contain and finally defeat Mizo aspirations is to come down heavily on them. That the MNF, despite the presence of quite superior Indian armed forces could so easily dictate terms to the government of Mizoram, to the extent that the chief minister himself has had to confess that his government has no control over, or even a clue to, the doings of the MNF tells its own story.

Clearly, the rebels are able to strike it will because they have popular support; every 'show of strength' in the shape of flag marches, every effort to 'isolate' the rebel elements, 'flush them out' from their hideouts, etc, will more surely make the Indian army appear in the eyes of an even larger section of the Mizo people than at present as a pure and simple occupying force. That, of course, has been the reality since 1966 — notwithstanding whatever useful work that might have been done by the Indian army in the midst of its other, more pressing duties.

The failure of the Centre's policy towards smaller nationalities in the peripheral regions is nowhere more starkly seen than in Mizoram. The failure is also difficult to understand for, after all, the Lushai Hills district of Assam was for long been an integral part of the state, more thoroughly integrated into it than the Naga Hills areas, and even the representative political organisations of the Indian ruling classes like the Indian National Congress and its various offshoots have been in existence in the region from as long ago as one can recall. Indeed, the emergence of disaffected elements in the area and their political consolidation is actually related to the efforts of the Congress party in Assam to prevent the entry of the rival All-Party Hill Leaders' Conference in the Lushai Hills district. That an area and a people so fully integrated into the Indian political system (including its system of patronage) should, within so short a period, become an arena of protracted rebellion which neither the might of the Indian army has been able to quell, nor the innate curruption of the Indian political system has been able to buy, only further highlights this failure of the government's policy towards the people of the region.

Small Industries

Dubious Claims

IN a special press release issued by the Press Information Bureau, the government has claimed what is described as "significant growth" of small-scale industries during the years 1974 to 1978. The number of small-scale units, it is claimed, increased by 48 per cent from 2.16 lakhs to 3.19 lakhs during this period and their output by 73.5 per cent from Rs 4,900 crores to Rs 8,500 crores. More significantly, employment is estimated to have increased by 47.7 per cent from 21.6 lakh persons in 1974 to 31.9 lakh persons in 1978. The small-scale sector now contributes, government claims, about 40 per cent of the total industrial production and its share in exports of non-traditional goods is also around 40 per cent.

If these claims are true, the record of small-scale industries should be considered impressive indeed. However, a careful scrutiny of the data casts many doubts on the reliability of the claims. To begin with, it is doubtful if the government has any systematic arrangements for getting accurate information on the output and other characteristics of small-scale industries, except through the CSO's Annual Survey of Industries (ASI) which is available with a few years' lag, the latest available being that for 1975-76. Also, more than 70 per cent of small-scale units registered with the Directorates of Industries fall outside the purview of the factory sector (because they employ less than 10 workers, etc).

A census of small-scale units was conducted in 1973-74 with 1972 as the reference year. Though there were at that time 2.58 lakh small-scale units registered with the Small Industries Development Organisation (SIDO), the census could tabulate data for 1.4 lakh units (or 54 per cent of the total) only, as units which started functioning after 1972 and the non-responding units had to be excluded. Along with the census, data were collected on production in the small-scale sector during the years 1970 to 1972. Considering that the small-scale units produced over 5,000 items, the data collected had necessarily to be in value terms. According to these data, there was a substantial increase in production of the small-scale sector in the years 1970 to 1972, "in spite of the unfavourable terms of business of the small entrepreneur"; the gross value of output increased by 31 per cent in 1972 over 1971 and 25 per cent in 1971 over 1970. The corresponding increases in the CSO's index of industrial production for medium and large-scale units were 5.8 per cent in 1972 and 4.2 per cent in 1971. Even the gross value of output for the registered sector at current prices had shown an increase of only 11.1 per cent in 1971-72 over 1970-71, as per the CSO's national accounts (the registered sector being all ASI units including small-scale units in the factory sector). For gross value added, we have CSO's estimates both for the registered and unregistered sector (the latter comprising household enterprises and non-household, ie, non-factory, small enterprises). In respect of the registered sector, gross value added at current prices had increased by 8.9 per cent in 1971-72 and by 10.6 per cent in 1972-73, and corresponding increases for the unregistered sector were 12.6 per cent and 11.2 per cent. Gross value added at 1970-71 prices had risen in the two years by 1.9 per cent and 4.1 per cent in the registered sector and by 4.7 per cent and 4.2 per cent in the unregistered sector. The SSI units must thus be deemed to be in a class by themselves —their production increases ranged from 25 per cent to 31 per cent while those of medium and large-scale units as well as those of household enterprises were far lower, having been less than 10 per cent or so.

This was the position for the years for which production figures were collected along with the census in 1973-74. For subsequent years, though production returns have been prescribed, it is not known what the response has been. From February 1976 onwards, even monthly production returns are being collected, but only on a 2 per cent sample basis. The adequacy of this 2 per cent sample was to be examined by the government, and, in the meantime, a 20 per cent sample was being used for collecting data on a quarterly basis. It is not known what the basis for the latest estimates of number of units, their output and employment is. However, as was true of estimates for 1970 to 1972, the present estimate also suggest exceptionally high growth rates for small-scale units as compared with the known levels of activity in the rest of the economy.

Doubts arise on many counts. Take the number of units. The census of Small-Scale Industrial Units had collected information for 1.4 lakh units for 1972. Now the number of units in 1974 is placed at 2.16 lakh units and that in 1978 at 3.19 lakh units. These figures are entirely at variance with the figures put out by the Reserve Bank, for instance. According to the Reserve Bank, the number of small-scale units financed by commercial banks increased from 2,10,258 in June 1974 to 5,12,842 in June 1978 (see RBI *Bulletin*, January 1979, and *EPW*, June 16, 1979). The latter figure is to be compared with that of 3.19 lakh units in 1978 as released by the government. Both figures relate to units registered with the SIDO, i e, units whose original investment in plant and machinery does not exceed Rs 10 lakhs from September 1975 onwards and Rs 7.50 lakhs for the earlier period.

[illegible] the discrep- ancy one can think of is that the number of units financed by commercial banks include, apart from manufacturing units, those engaged in processing or preservation of goods, whereas the government data are only for manufacturing units. This explanation is not very convincing, however. First, the 1973-74 census had defined industrial activity to include manufacture, assembly, job work (production and processing), repairing and servicing. Secondly, for 1974, the number of units reported by the Reserve Bank was actually lower than that reported by the government. Thus there are glaring and inexplicable discrepancies between the number of small-scale units as reported by different official agencies.

The official estimates of growth in output of small-scale industries are disproportionately high compared to growth of output in the organised sector of industry or compared to the general level of economic activity. According to the press release, the increase in output of SSI units in a period of four years from 1974 to 1978 works out to 73.5 per cent or a simple annual average rate of 18.4 per cent. During the same period, the CSO's index of industrial production (1970=100) for medium and large-scale units registered a rise of 29.2 per cent, i e, a simple rate of 7.3 per cent per annum. True, for medium and large-scale industries the figures are of physical output, whereas the estimates of output of small-scale industries are in current prices. Hence even if the estimates for small industries are correct, their publication without correction for price increases does present a misleading picture. This is evident from the fact that CSO's data on national income show that the gross domestic product at factor cost originating in registered and unregistered manufacturing sectors at 1970-71 prices increased by 18.1 per cent and 21.3 per cent, respectively, between 1973-74 and 1977-78, i e, at annual rates of 4.5 per cent and 5.3 per cent.

Similarly, the claim that employment in the small-scale industrial sector increased by over 10 lakhs in a period of four years has no firm basis. During the period for March 1974 to March 1978, private manufacturing units in the organised sector added only 1.38 lakhs to employment and the public sector manufacturing units another 2.98 lakhs, together making a little over 4 lakhs. A large number of small-scale units are already covered by these employment statistics for organised sector collected by the Ministry of Labour and Employment which relate to all non-farm establishments in the private sector employing 25 and more workers on a compulsory basis and those employing 10 to 22 workers on a voluntary basis. Despite such wide coverage, these employment statistics independently collected do not at all substantiate the claims of increase in employment in SSI units made by the Industry Ministry.

Politics

Dreams of Grand Realignment

POLITICAL PARTIES have certainly been having a field day, and they hogged all the headlines last week. The week began with the expulsion of Devaraj Urs from the Congress(I) and the conversion of his following into the Karnataka Congress and the resignation of Raj Narain from the Janata party and of Devi Lal from the leadership of the Haryana legislature party. The following day, being the anniversary of the declaration of Emergency four years ago, was dominated by even more newsworthy events — like the pitched battle between the army and the CRPF and the CISF in Delhi and Bokaro, leaving (officially) about 30 dead and more than sixty injured; and the Prime Minister doing his bit to add to the drama by announcing that some kind of a preventive detention law was in the offing. After this, the pronouncement of the Industry Minister — that the socialists in the Janata too would be having a conclave of their own — could not but be an anti-climax, especially in view of the fact that the announcement, if intended to be a threat to join the ongoing game of realignment of forces, could not be taken seriously, given the position of the former socialists in the present correlation of forces in the Janata.

It would be tempting to see in these and other recent developments the 'grand realignment' of forces that has been so much in the air for more than a year now. Till now, the shifting alliances within the Janata contributed the grist to the mill of such speculation; but with the developments in the Congress(I) and the call for unity of all Congressmen 'wherever they are' given by Devaraj Urs, there is naturally much speculation that those reluctant elements in the Janata too who can trace their political origins to the Congress might respond to such a call.

Such hopes and expectations can, at best, be attributed to political innocence and wishful thinking. The Janata party, despite [illegible] hecism, is sti[illegible] If only because the malcontents in the Janata do not have a more coherent programme to agree upon than what they have been managing with at present.

So, the programme of realignment, if any, will be a purely Congress affair. But even here, the response from within the Congress to Urs's call for realignment has been less than enthusiastic. Most of the Congress leaders who have welcomed the call had already broken with Indira Gandhi, and the success of the Urs endeavours has to be judged from the dent he is able to make in the Congress(I) outside Karnataka.

But even if the present efforts of Urs should not result in an immediate and large-scale exodus from the Congress(I) to the Congress, the strengthening of the organisation of the Congress party itself — under whatever initials or nomenclature, it might be designated — would still be an important item on the agenda of Indian politics. For, the strengthening of the Congress party is an integral part of the larger strategy of seeing to it that a 'stable, two-party system', which can ensure the continuance of the present political arrangements, emerges in India. Ensuring that the Centre will continue to hold, even if rather precariously, is apparently the most immediate task; but that itself can be ensured only if a 'viable alternative' to the Janata is created. After all, the Janata party too arose as an answer to such a need for a 'viable alternative' to the Congress; and the imposition of Emergency only served as the midwife to that historically 'felt need' of the Indian ruling classes

But the problem with this neat scenario that is being prepared for the Indian people is that there are a far larger number of imponderables now and the general loss of control over the instruments of governance is only one of the many qualitative differences that exist between the objective situation as prevailed even as recently as five years ago and now.

And yet, both consolidation and realignment will be sought, for the Janata, as much as the Congress, has vital stakes in ensuring the emergence of this 'strong, viable alternative'. What is however less certain is whether the forces released during the two years or so of Janata rule can at all be contained by these rather transparent devices; or whether new structures of repression will have to be deviced in order to ensure the continuance of the present arrangements.

The Political Vacuum

Romesh Thapar

FROM Calcutta to Bombay to Delhi — and, then, to god knows where. The electricity black out is spreading, closing industry, commercial establishments, hospitals and what have you, apart from driving citizens round the bend in these summer months. The power stations say the coal is not reaching them. The railways say there is no coal to lift at the mines. The coal authority says that there are no railway wagons available. While all this is on, the Prime Minister is jetting around the USSR and Eastern Europe with an entourage larger than his External Affairs Ministry staff. His colleagues back home are locked in discussions on the future of Charan Singh's BLD, or gossiping about the confrontation between Indira Gandhi and Devaraj Urs.

At the level of the ordinary people, both urban and rural, it can safely be said that politicians are fast becoming anathema. The trouble is that no alternative to the shattered Westminster model is being posed by any of the parties, whether Jana Sangh/RSS, Socialist or Communist, or plain nationalist. Only the authoritarians can be heard repeating that there is no other way except Emergency rule. The Janata wafflers have brought the country to this desperate plight within two years.

Our continental system, or whatever remains of it, manages to struggle along without political or economic direction because at a certain level productivity is still possible and the monsoons keep their appointment with Bharat. But the chaotic handling of a very favourable situation is rapidly pushing us into two-digit inflation and a breakdown in the supply system. Competing trade unions, oblivious of the country's interests as always, are merrily creating the sanctions for authoritarian measures by encouraging critical go-slows on transport systems, disruptive strikes calculated to serve some mean interest, and various blackmail moves which have nothing to do with the interest of the working people.

It is no use singling out the Janata party for abuse. Every political formation seems determined to play for votes in the most narrow sense, forgetting that if we pursue this path there will soon be no votes for gathering. The recent by-election results are clear at least in one area. The Janata party is being rejected all over the country. Any working combination opposed to it can show considerable strength. But the alternatives are all the same, capable only of stop-gap solutions.

Unless some very solid effort is made by the Chandra Shekhars, the Urs, the Bahugunas and the Limayes to work boldly for an alternative continental party, united organisationally and programmatically, the voters will move increasingly in the direction of regional consolidations. Under the present Westminster model, this would mean for certain coalition governments at the Centre — not the chaotic spillover of a Janata-type operation, but something more carefully assembled and orchestrated.

Irrespective of what we feel the future political structuring of India should be, a period of coalition functioning might give us the time to structure the federal polity more organically with the traditional participative systems which are still alive in our political practice. While it is true that such sentiments are not being expressed in public for fear that they may cause misunderstanding and confusion, all private discussions are laced with these thoughts. It is at last obvious to important and decisive elements in the political hierarchy that there is something profoundly wrong with the political and economic system, and that no amount of personality manipulation is going to change the serious character of the crisis.

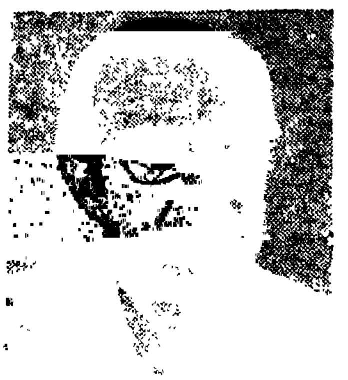
Actually, we are on the brink of a situation which might persuade the Janata party to plunge for a freeing of the economy from controls and public sector restraints. Already, various "expert" committees are making noises which add up to saying that the jungle of controls and regulations is suffocating productivity at all levels, including even the intellectual. This may well prove to be an attractive escape from the hard and tempestuous challenge of putting our affairs into working order. Free-wheeling, however, in a continental setting holds many political dangers as we can see from the remorseless money-making activities of our "contractors" and "traders" in tribal belts, frontier tracts and backward areas. Whatever the argumentation around this issue, I have never known the mood to be so favourable to a demolition of our "scialism".

The extraordinary national interest that has developed in Devaraj Urs, the successful chief minister of Karnataka now cutting off from Indira Gandhi's gangster politics, is an indication of the intensive search for someone who makes sense and who might give the country the leadership it is looking for — yes, the Grover Commission notwithstanding. It is the kind of attention Chandra Shekhar drew before he became a pale reflection of the Janata party's perambulations, or Limaye before he allowed himself to be too closely associated with the CPI. Interestingly, Bahuguna has never reached this point of recognition because he is narrowly involved in Uttar Pradesh — and is too clever by half.

The existence of a political vacuum has encouraged speculation about various political possibilities never discussed before. This is idle activity, for the answers to our political disarray have to be put together as a result of political battle. But who will head the battle, organise it, and move it into the crucial areas of continental revival? It is an open question, and the longer it remains open the graver the damage to the frail economic and social structures which have been built up over thirty years. We wait and watch in the Capital, haunted by despair.

June 23

Metal Box India



METAL BOX INDIA has this year again been awarded the CLIO gold statue of New York — the world's most coveted award for excellence in package design — for the third year in succession. It is indicated that Metal Box India is the only company in the world to receive this award three years running, a record for Indian packaging.

This year the CLIO has been awarded to a tea caddy titled Old Calcutta, designed and produced by Metal Box for Duncans Agro Industries Limited, Calcutta. The exporting of Indian branded teas to world markets is a comparatively recent phenomenon, and currently a booming trade.

Dunlop India Chairman's Speech at Annual General Meeting

THE MOST IMPORTANT PERSON IN OUR BUSINESS IS THE CUSTOMER

"The part that Dunlop can play is to improve its efficiency, continuously upgrade product performance to provide the best value for money and to offer a complete service for the satisfaction of our customers. This we pledge to continue to do."

Mr. A. W. G. MacIntyre

The following are excerpts from the speech delivered by Mr. A. W. G. MacIntyre, Chairman, at the 53rd Annual General Meeting of Dunlop India Limited, held on June 15, 1979, at Calcutta:

At last year's Annual General Meeting, I was able to report signs of some recovery from the depressed conditions experienced by the Company and the Tyre Industry as a whole in 1977. This recovery was sustained throughout 1978 despite the adverse effect on road transport activity of an unusual monsoon season in some northern and eastern regions. In particular, the disastrous West Bengal floods severely disrupted production at Sahaganj, while sales demand fell off in areas where road movements were restricted over a period of several weeks.

Sahaganj was also plagued by shortages of electricity and coal of acceptable quality. Consequently, there were times when we were unable to meet market demand for certain sizes and types of products. Economies were made wherever possible to make up for the volume loss and this included tight control on working capital. We were, however, able to respond to a great extent to the increasing market shift to nylon in the truck tyre range. This was possible with the installation of additional Bag-O-Matic presses at our Sahaganj factory.

Our Industrial Products division, which had another satisfactory year, also benefited from capital investment in such products as fan and vee belts. I should mention here that we have decided to divisionalise our two main lines of business, i.e., Tyres and Industrial Products. This will give increased thrust to our efforts to improve their individual performance and give better customer service.

Profit not Adequate

The sharp fall in profits suffered by your Company in 1977, which resulted in a cut in dividend in that year from 20% to 8%, has been arrested. However, a profit before tax of a little over 2% of income is just not enough. It is not enough to pay you the dividend you received two years ago and it is certainly not enough to plough back the internally generated funds which are vital to our modernisation programme and to our future as suppliers of essential goods, exporters, employers and good corporate citizens.

Prospects in 1979

This year opened with reasonable market demand, but our early hopes of making real improvements through higher factory productivity have been adversely affected by severe power problems, perhaps the worst ever.

However, a continued effort in improving operating efficiency makes me reasonably confident that we can achieve a further improvement in results during 1979. If we do, it will be because of the untiring efforts of our employees, often under difficult conditions. I can assure you that their spirit and sense of motivation are a great source of strength to this Company.

Extremely Difficult Raw Materials Situation

I now turn to the extremely difficult position of the major raw materials required for our Industry — specially tyres—both in terms of availability and prices.

It needs to be emphasized in this connection that:

(i) Natural rubber and petrochemical based materials, such as synthetic rubbers, nylon yarn and/or caprolactum, carbon blacks, rubber chemicals, etc., account for over 90% of the direct material costs of a nylon truck tyre.

(ii) Local availability of these materials for the Indian Rubber Industry is not adequate and, consequently, substantial quantities have to be imported regularly.

(iii) Import duties on most of these materials are prohibitive, e.g., the total incidence of import/countervailing excise duties is over 180% for Nylon 6 Yarn, nearly 140% for caprolactum, 52% for synthetic rubbers and 102% for carbon blacks.

Availability of natural rubber has been uncertain since April 1978 when, due to the inadequate stocks in the country, prices of RMA I shot up from Rs 6,500 per tonne in early 1978 to over Rs. 12,500 per tonne during the second half of 1978. This is partly due to a decline in natural rubber production in India—only 135,000 tonnes have been produced during April 1978/March 1979 as compared to a consumption of 165,000 tonnes. The imports arranged so far by the Government—15,000 tonnes in August/October 1978 and 15,000 tonnes in April/May 1979—have been just equivalent to the deficit between consumption and production during the last financial year and are, consequently, totally inadequate for building up the additional stocks required in the country. Moreover, even the import of these 30,000 tonnes has not been arranged in time when the need to bridge the gap between requirements and availability has been greatest. Prices have, therefore, remained at high levels and, in fact, over recent months are between 40% and 60% above the revised floor price of Rs. 8,250 for RMA I fixed by the Government. Earlier this month Government recognised the seriousness of the situation by announcing its decision to import a further 30,000 tonnes over the next few months when local supplies will be affected by the monsoon conditions. This decision is welcome, although unfortunately world market prices have risen again in recent weeks.

The position with regard to petrochemical based materials is also alarming. For instance, apart from being in short supply, the CIF price of imported caprolactum, which is the base material for Nylon 6 Yarn, has increased during the last six months from $900 to $1700 per tonne. The price escalation in the case of the other materials mentioned by me, although not so great, still averages over 25%.

In these circumstances, it is urgent that Government implement the following important representations made by the Industry during the last twelve months.

(i) Timely and duty-free imports of natural rubber so that prices remain reasonably stable between the floor prices already announced and ceiling prices which are yet to be announced (which would trigger imports).

(ii) Reduction in the import duties on butyl, SBR, nylon yarn and carbon blacks, where imports are necessary due to inadequate availability in the country.

Licensed Capacity Stagnation Not in Public Interest

In this era of rising costs, it is not possible for a company to remain viable and protect employment without growth in output. We have proposed to Government that a 5% annual increase in existing licensed capacities should be permitted to provide incentive for productivity – improvements and modernisation of obsolete equipment, both of which are necessary for the continuing health of an organisation. In particular, companies such as yours, who are working within industrial licences issued many years ago, should be permitted to expand in existing products and enter new businesses, which are outside the capabilities of the small scale sector

COMPANIES

Basking in Road Transport Boom

Hansavivek

DUNLOP INDIA has shown a substantially improved performance for 1978 with a gross profit of Rs 6.81 crores against Rs 3.72 crores previously following higher sales of Rs 146 crores against Rs 131 crores. These figures show that gross margins have doubled. Net profit is Rs 2.80 crores (Rs 1.11 crores). Dividend is stepped up from 8 per cent to 12 per cent. This outcome has followed improved demand for truck tyres and favourable market conditions for industrial products. Both divisions, however, were faced with increases in the cost of natural rubber and other raw materials and higher conversion costs. What helped the company to recover these costs were increased production and higher selling prices. The ouput would have been still higher, but for erratic power supply and shortage of coal and some raw materials. Turnover was also affected by severe floods in large areas of north and east India. The company incurred capital expenditure of Rs 6.12 crores compared with Rs 3.65 crores in the previous year. The major investments were in respect of expansion and rehabilitation of Sahagunj factory. Capital expenditure was also directed towards improving the technological content of tyres and industrial products. Despite the substantial capital expenditure, there was a temporary reduction in short term borrowings due mainly to lower average working capital. This resulted in saving in interest burden. The proposed issue to the financial institutions of debenture stock amounting to Rs 1.17 crores is still under negotiation pending finalisation of issue conditions, particularly those related to the forms of security to be given by the company, which are acceptable to all parties. The management hopes to resolve the matter shortly. The proposal to acquire the whole of the share capital of India Tyre and Rubber Company (India) is still being considered by the appropriate authorities It is expected to be finalised during this year. Commenting on the current year's prospects, the chairman says that the year has started on a more promising note with increased sales. While raw material supply situation and shortage of power in West Bengal give rise to some concern, substantial capital expenditure and technical work undertaken by the company have improved its competitive position in the market.

SHRI DINESH MILLS has fared very

well during 1978 with higher volume of production and record sales. What, however, is more impressive is the increase in margins. On sales up from Rs 8.93 crores to Rs 10.37 crores, gross profit has expanded from Rs 1.08 crores to Rs 1.49 crores. Net profit is Rs 70 lakhs against previous year's Rs 52 lakhs. Dividend is raised by two points to 14 per cent and is covered 4 times by earnings. Over the year, reserves have increased from Rs 1.58 crores to Rs 2.35 crores to stand against the equity capital of Rs 80 lakhs. These good results have been obtained despite rise in costs due to increase in prices of raw materials and other inputs and in excise duty. Prices of imported raw material, bought mainly under OGL, have remained more or less steady. Prices of Indian wools were very high and their availability became difficult for making apparel fabrics because of the keen demand from carpet manufacturers. The management feels that this situation is likely to continue in the coming years. Supplies of woollen fabrics to the defence and DGS and D were affected on account of intense competition. The company is, therefore, trying to concentrate more on the civilian market. Production and sales of the felt division were higher. Newer styles as well as 100 per cent synthhetic felts and drier screens, introduced in the market, have been well received. The wool combing plant at Ankleshwar has been working at targeted production. The top dyeing plant has been shifted from Baroda to Ankleshwar. The company is importing 20 Sulzer looms and expects to commission them by October next.

BHARAT COMMERCE AND INDUSTRIES has fared so well during 1978 that the directors have stepped up dividend from 10 per cent to 15 per cent and the enhanced distribution is covered four times by earnings. On sales up from Rs 49.22 crores to Rs 56.85 crores, gross profit has trebled from Rs 1.12 crores to Rs 3.37 crores and net profit has quadrupled from Rs 40 lakhs to Rs 1.66 crores. These impressive results have been obtained despite labour unrest at practically all the units of the company "due to inter-union rivalries". All the four spinning units continued to operate efficiently. The fabric division, however, did not perform well because of keen competition and uneconomic levels of prices. As the company does not have its own weaving and processing facilities, the management is considering this matter. For the first time, the aviation division undertook spraying of rubber plantations in Kerala. The overhaul workshop at Safdarjung has started doing jobs of other parties. The company is pursuing modernisation schemes and is implementing them according to availability of finance and machinery.

BOMBAY PAINTS AND ALLIED PRODUCTS has shown a marked improvement in its performance during 1978. Sales have increased from Rs 3.37 crores to Rs 4.56 crores and gross profit has advanced from Rs 15 lakhs to Rs 26 lakhs. Net profit is Rs 9 lakhs against Rs 5 lakhs previously. Dividend has been raised from 10 per cent to 12 per cent and is covered 2.25 times by earnings. Improved profitability is attributed to the easy availability of raw materials and stability of their prices coupled with a better product mix. The directors say that profitability would have been still better but for considerable increase in cost of packing materials. Sales of 'Hempel's' marine paints were lower at Rs 82

lakhs against rupees one crore in the previous year due to recession in the shipping industry. It is proposed to allot 30,000 equity shares of Rs 10 each at par to Hempls's Marine Paints. This may enable the company to obtain technical knowhow for a long uninterrupted period without payment of any royalty. The company's exports were also lower at Rs 14 lakhs against Rs 20 lakhs.

AGRICULTURAL FINANCE CORPORATION recently convened a meeting of the representatives of commercial banks, State Governments, KVIC, State Khadi and Village Industries Boards, ARDC and other related organisations for reviewing the progress achieved in setting bio-gas plants and participation by commercial banks. Addressing the meeting, Ghulam Ghouse, managing director, AFC, said that during the four years from 1974-75 to 1978-79, 74,622 bio-gas plants have been set up. Commercial banks have extended a loan of Rs 291 lakhs for setting up 26,012 plants during July 1976 to June 1977. He further pointed out that commercial banks will continue to support their programme during VIth Plan period in view of the fact that Government of India has targeted to set up 2,00,000 family size, 50 community and 25 night soil bio-gas plants during the Plan period involving an outlay of around Rs 70 crores.

Among the various suggestions made by the representatives of the governments of Maharashtra, Gujarat, Rajasthan, Karnataka, UP, Punjab, Bihar, Haryana and others, are : (1) the government should continue to provide subsidy for implementing the programme; (2) ARDC refinance facilities to commercial banks who extend loans for setting up bio-gas plants should be expeditiously utilised; (3) community Bio-gas Plants should be set up on experimental basis with the help of gram panchayats particularly with a view to helping small and marginal farmers benefit from the scheme; (4) adequate sevicing facilities should be organised once the plants are set-up; (5) co-ordinating committee consisting of commercial banks, state governments, KVIC, ARDC, AFC should be set up at state level for implementing the programme during the sixth plan period; (6) suitable extension programmes should be undertaken to educate rural people on the advantages of bio-gas plants and economic benefits that would accrue to them and (7) the cheaper Janatha model developed needs to be popularised with adequate publicity back up so that financing institutions could provide necessary support.

BOMBAY TYRES INTERNATIONAL (formerly known as Firestone Tyre and Rubber Company of India) is issuing to the public 10 lakh equity shares, of Rs 10 each, for cash at par to reduce the non-resident shareholding to 74 per cent under FERA. The subscription list will open on July 9. The issue is fully underwritten. The company received underwriting offers of over Rs 3.5 crores, against its requirement of Rs one crore. The company's paid-up capital of Rs 2.20 crores held by the parent company, Firestone Tyre and Rubber Company of USA, was increased to Rs 3.33 crores by the latter's additional injectment of cash in US dollars equivalent to Rs 1.13 crores in October 1978. Apart from the public issue, Rs 17 lakhs of equity shares are reserved for employees and business associates. Total issued and paid-up capital after this issue will thus be Rs 4.5 crores. The company, incorporated in 1930, started in 1940 manufacture of Firestone products in India. It has operated profitably since 1941, except in the last two years, when there was demand recession following the oil crisis, power cuts, and higher costs of inputs. Operating results for the current year have since improved. According to R L Steinmetz, chairman, the company's working during the first six months of the current financial year has shown a profit. Turnover for 1979 is expected to exceed Rs 75 crores. The company's products enjoy wide acceptance in India and abroad. The company will continue to make Firestone products in India with full support from the parent company's research division, whose expenditure last year was nearly Rs 52 crores. The public issue is managed by SBI.

SANDOZ (INDIA) has had another good year. With increased contribution from each of the divisions, it has achieved higher turnover and profits. What is more, profit margins have increased although costs have been rising and selling prices have remained unchanged. Dividend, maintained at 16 per cent on the capital enlarged by a bonus issue, is covered 3.8 times as against 3.53 times previously. The dyes division introduced many new products based on knowhow provided by Sandoz, Basle. The management feels that the government decision to reserve certain ranges of dyestuffs for the small-scale sector will impose a major constraint on future growth and development of the organised sector of industry. The pharmaceutical division exported finished drug formulations worth Rs one crore despite stiff competition in the international market. As part of the import substitution programme, the division has taken up basic manufacture of Clopamide. Commenting on the new drug price control order, the chairman, S Ranganathan, says it is likely to have a severe impact on the operations and profitability of the pharmaceutical division. The agrochemicals division, which is the youngest, has continued to make good progress.

INTERNATIONAL INSTRUMENTS is coming to the market on July 18 with a public issue of 7 lakh equity shares, of Rs 10 each, at a premium of Rs 2 per share to raise part of the finance required for its Rs 3.5-crore expansion and diversification programme. Since 1958, the company has been manufacturing, at Bangalore, a range of automobile dashboard instrument. The products are marketed under the brand name 'YENKAY'. Today, more than 85 per cent of the vehicles, including two-wheelers, plying in the country and fitted with the company's products. The company also manufautures instruments for tractors, industrial and agricultural applications, tachographs for roadways and railways, efficiency recorders for machine tools, electronic hour meters, and special float switches for aircrafts. In view of the large-scale expansion plans of the automobile industry, the company has planned to expand its capacity. As a measure of diversification, it is entering the field of ticket-issuing instruments. A technical colloboration agreement has been entered into with Ticket Equipment of UK for manufacture of 5,000 numbers instruments per annum. For this purpose, a new plant is being set up at Bommansandra, a 'backward' area. Commercial production is expected to commence from January 1987. The company has good past record of sales and earnings. During 1978, it earned a gross profit of Rs 104 lakhs on sales of Rs 6.87 crores as against Rs 80 lakhs and Rs 5.77 crores, respectively, in the previous year. Net profit was Rs 26 lakhs (Rs 22 lakhs) out of which 12 per cent dividend absorbed Rs 14 lakhs.

TAMIL NADU

AIADMK in True Colours

TWO parliamentary elections were forced on the people of Tamil Nadu by the ruling party, the AIADMK, one way or the other. Ministerial ambitions of the party's MP from Thanjavur and the alleged murder of the CPI MP from Nagapattinam by a member of AIADMK had caused the two vacancies.

The two regional parties, DMK and its splinter AIADMK, still being the main contenders for power in Tamil Nadu, the electoral alignments have revolved around them. The recent elections witnessed yet another grouping of parties — AIADMK and Congress (I) pitted against DMK, CPI, CPI (M), Janata and a host of other small parties. This was the first time that the CPI had found itself ranged against the Indira Congress in alliance with the Janata. The CPI (M) had also, for the first time, come out unequivocally against the AIADMK, irrespective of whether the latter aligned with Congress (I) or not.

It is worth recalling the developments since the Madurai Corporation election last year when the AIADMK was opposed by both the Communist parties and had been pushed into the exclusive embrace of the Indira Congress. Even the CPI, which would have found an electoral alliance with Indira Congress and AIADMK an occasion for revolutionary rejoice, had shunned the two parties. Given the 'Bhatinda' line, it could not seek the warmth of an alliance with the Indira Congress so soon, some of its state leaders' undiminished admiration for Indira Gandhi notwithstanding. The state's celluloid Chief Minister, M G Ramachandran, in his excessive zeal to be the self-appointed servitor of local capital, has so succeeded in making himself something of a political untouchable, that parties with even a lesser pretension to leftist ideology than the CPI would find it difficult to be seen near his party. Even the Congress (I) had only squirmingly shared its platform with AIADMK and this would have been so even without the high drama that lost Thanjavur to Indira Gandhi even before she could contest.

Repression of Working Class

M G Ramachandran lost his friends in one stroke, last October, when he capped a long series of silent betrayals with an open and wanton attack on the organised workers of TVS and TI cycles. The bandh held then was the first state-wide united action of the opposition parties barring Janata and Congress (I) to protest the government's anti-labour policies. The role of the Janata in this was dubious as it claimed solidarity with the workers but declined to join the bandh. Indira Congress naturally steered clear of the bandh since it was the INTUC that M G Ramchandran had sought to foist on the workers of TVS and TI, literally at gun-point.

Although the unity of the opposition had come too late to help the workmen of TVS and TI, the workers of SIMCO in Tiruchy benefited a great deal. As in TVS, in SIMCO the confrontation was between the INTUC and CITU — the latter attempting to undo a settlement forced on the workers by the foremen. The entire town of Tiruchy rose as one man to support SIMCO workers and there were several state-wide actions as well, including dharnas inside the Assembly. Only such a united stand by the political parties and the unfailing determination of the workers in the face of goondaism by the 'white army' of the AIADMK and police action, was able to counter, the pressure of the SIMCO proprietor, who had been the very first to receive the Chief Minister and do the necessary honours when the latter landed in the US. The SIMCO struggle had then already begun.

The struggle lasting four months and carried on as much in the legislature as at the factory gates, compelled the Chief Minister to deviate from his "firm" policy that an agreement made under Sc 12(3) of the ID Act shall never be violated and to concede a wage increase, even while an agreement made by the hated INTUC union was in vogue. The MGR philosophy, faithfully implemented by his more-loyal-than-the-king labour minister, an ex-union leader himself, has again revealed itself in the textile industry dispute. The textile workers are up in arms demanding increases in wage levels not revised since 1974. Their impatience is further fanned by the windfall profits the industry has made in the last three years. The government showed no interest at all in the matter until the strike notice was issued. On the second day of the strike, with no serious effort yet initiated to solve the dispute, it referred the dispute to adjudication. Making no reference to the merits of the dispute the Chief Minister — and in this he was joined by George Fernandes — gave a call to the workers to withdraw the strike. The police also have simultaneously swung into action, lathi-charging the workmen who have thronged the ESI Offices.

Foisting false cases and rounding up workers at the behest of managements are not MGR's innovations, but special to his style has been the policy of not withdrawing the charges even after an amicable settlement had been reached at the work-spot and normalcy restored, as had been customary so far. All requests for withdrawal have been met by the staid reply " the law will take its own course".

However, to soften the abrasive edge of opposition action, MGR made an independence day declaration last year that all cases against workers would be withdrawn excepting those involving in destruction of poverty and physical injury. In fact, however, no cases were withdrawn by the police. A few months later, an incident took place that compelled the Chief Minister to further modify his "law will take its own course" injunction — large-scale vandalism, mainly destruction of property, was indulged in by Indira Gandhi fans on news of her arrest. This vandalism included the organised bombing of a bus, killing several people. Quickly rallying to succour his mentor's chelas, MGR modified his directive to release all excepting those charged with attempt on life. Yet cases against workers withdrawn have been minimal and blatantly discriminatory. A recent government order most significantly says that all political cases booked after 1972 — the year MGR walked out of the DMK — will be reviewed and suitable action taken!

That MGR is no great champion of civil rights should not be news to any one who has watched his unswerving admiration for Indira Gandhi and the "gains" of her Emergency. Highly illustrative is his attitude towards the report of the Ismail Commission, appointed before his coming to power, to probe atrocities committed on prisoners in the Madras Central jail during the Emergency. Departmental enquiry is said to be going on against some of

those held responsible by the Ismail Commission for the brutal beating up of political prisoners, mainly the DMK, during the Emergency. Although punishment has been long in coming, reward for ill-treating the Chief Minister's enemies has been prompt. Paramaguru, the then IG of Prisons, against whom strictures were passed by the Commission, has now been promoted as one of the four IGs in the "reorganised" Police, his ninth rank in the order notwithstanding.

The government is also supposed to be considering the recommendations of the Anantha Narayanan Commission, the state counterpart of the Shah Commission. Indications so far suggest that no one need fear that the Chief Minister might deal severely with those who took the law into their own hands, as he is often given to declaring, when faced with mass agitations. The Commission to go into the excesses of the DMK regime — no doubt after 1972 — could be cited as the only instance of the Chief Minister's roused conscience.

The notorious Prohibition Act amended by the present government, which makes burglarly and even murder seem petty crimes compared to possession or consumption of liquor, has come as a boon to the police to terrorise the poor and anyone who crosses them or the ruling party. That this act had rendered the police terribly corrupt is public knowledge. This corruption with absolute power starts at the very top: MGR recently warned his cronies in the movie world that but for his benevolence, 95 per cent of them would be in jail for violating the prohibition act.

Communal and Caste Riots

Tamil Nadu under AIADMK has proved no exception to the general trend of rising communal and caste conflicts. Atrocities against the scheduled castes in particular have shown a phenomenal rise, but the government has evinced no special concern. Apathy, however, has not been the only sin of the government; on occasions its men have also been the prime instigators of these horrors. The party's MLA was widely reported to have been involved in a leading role in the Villupuram riots in which 12 Harijans were killed. Several ruling partymen were rounded up in a recent incident of arson in Panrutti where 400 huts of scheduled castes were razed.

The demand of the local RPI that a Harijan member should be included in the commission of inquiry into the Villupuram incident was turned down by the government which found it quite convenient to accept the findings of the one-man commission which exonerated the MLA and contented itself with passing strictures against the local police for not taking "proper action against local rowdyism" by some Harijans. It must have pleased MGR to no end that the report decreed the riots not communal in character, a finding that he himself had announced before the commission was appointed. Even more pleased must he have been at the gratuitous references in the report to political interference in police during the DMK rule and the absence of such interference in the incident under study.

To MGR attacks on the vulnerable sections of the people had never been a "law and order" problem; this was always the exclusive handywork of industrial workers, farmers and students. When Venkatachalam, a CPI(M) leader, working with the landless in Thanjavur, fell victim to a dastardly crime, the local landlord to whom all suspician led, was not even arrested and for nearly two years the police have pleaded inability to locate the body or the murderer.

When, however, a landlord in Ramanathapuram and a village official in Thanjavur, were killed some months ago, the government alleging Naxalite involvement, rounded up about 400 men from the three communist parties and a host of others with no organisational loyalities.

The agriculturists' agitation continues to dount MGR. Led by rich farmers — who, characteristically, have demanded cancellation only of co-operative debts and not debts from non-institutional sources — the movement has managed to inspire both the big and small farmers, thanks to the government's total failure to isolate the kulaks by offering concessions to medium and small farmers.

The agitation led to police firing in April 1978 which claimed 14 lives. Exactly a year after, in the firing in Vagaikulam, in the Chief Minister's own constituency, five people, including two peasant women, were killed. Not concerned in the least, the Chief Minister asked the police to continue to deal with law-breakers firmly and broadcast a most provocative speech — this has become customary by now — on the eve of the state-wide bandh called by the agriculturists' union led by Narayanasamy Naidu, to protest against the Vagaikulam firing. More blood was spilled and two more lives were lost.

The peasants of Vagaikulam and some other villages had on several occasions in the past stalled the digging of wells by the government to supply drinking water to some villages, on the apprehension that the water table would go down and their irrigation wells would dry up. It took the killing of five people for the Chief Minister to order an inquiry to find out whether there was any basis for their fears. Such an assurance given earlier would have saved the five lives, but would have been totally out of tune with MGR's style. With the promptness customary on such occasions, Rs 5,000 was granted to the bereaved families.

The protest bandh called for April 23 might have passed off without claiming further lives but the government had foresworn that the bandh would be a flop and was determined to prove itself right. The "firm" handling led to the death of a Sub-Inspector and a youth. In several villages lives were spared, but the lathi was not. And it was in the village of Valliyur near Madras that sexual equality before the police lathi was fully established. Women of all ages — the young and the very old not exempted — were pulled out of their house and beaten black and blue. The police went berserk there for one full day. Several women were arrested and kept in an open lorry for more than a day without food or water and later dumped in Madras jail. The furore that this incident caused sent MGR out on his usual PR exercise; accompanied by a woman minister, he visited the village and those in the hospital. After the visit, the woman minister was particular in lauding a major police achievement: no woman had been raped. That done, MGR castigated the women for taking part in any kind of struggle at all and vowed that the 'cowardice' of putting women to the forefront in struggles will be tackled; Valliyur was the beginning.

Although MGR's much flaunted march to Delhi to demand a "fair" procurement price for the paddy growers fizzled out as suddenly as his "draft Indira for Thanjavur" call, he was quick to raise the price by Rs 20 just a week before the election. Only a few weeks ago he had declared categorically his inability to increase prices unless aided by the Centre! Apart from Thanjavur being the rice bowl of Tamil Nadu Indira Congress

which had fielded its candidate there banked heavily on the upper strata of the peasants who would most likely benefit from it. The majority of the farmers are out in the cold as the state is not prepared to go in for massive procurement and they would have to fall back on uneconomic market prices.

By-Election Results

It was against the background of this performance by MGR's ministry that the recent by-elections were keenly watched. MGR, who had repeatedly postponed the municipal and panchayat elections, was desperate to gather as many allies as possible. In the event, only Congress(I) was possible, even that on the humiliating condition spelt out by Indira — we do not seek their support, but if they want to support us, let them. MGR's gyrations included seeking of Janata support in Nagapattinam after pledging Thanjavur to Congress(I) and a sudden offer to CPI, just one week before the polls, to withdraw opposition in Nagapattinam if CPI would support Congress(I) in Thanjavur.

But MGR need not have worried. His campaign trail showed that the masses in villages turned out for a glimpse of their movie hero in as large numbers as ever before. Tamil Nadu which voted solidly for Congress(I) after nineteen months of Emergency once again proved that attacks on industrial workers or students or any such minority segment of the society has still not become a mass issue. The voting pattern revealed no significant shift in trend from the last parliamentary and assembly elections, after allowing for alignments in the different elections.

The AIADMK — Congress(I) combine took both Thanjavur and Nagai in the February 1977 general elections, the AIADMK winning the former with a margin of 97,000 votes and the CPI taking the latter with a margin of 41,000 votes. The assembly elections four months later saw DMK going it alone, CPI with Congress(I) and CPI-(M) with AIADMK. With a three-way split of votes, DMK took seven of the 12 assembly seats in the two parliamentary constituencies, CPI took two, Congress(I) one, AIADMK one and CPI(M) one. Janata, which also was on its own, lost deposits in most places.

The present elections had AIADMK and Congress(I) together in an uneasy relationship with all other parties ranged against them in one block. Congress(I) won Thanjavur with a substantial margin while AIADMK lost Nagapattinam narrowly. The PCC President of Congress(I) commented: "If only MGR had worked as hard for his own candidate at Nagapattinam as he worked for the Congress(I) candidate at Thanjavur, his party would have taken Nagapattinam as well."

Amidst the CPI's euphoric statements of "left, and democratic" victory in Nagapattinam has come the only sober assessment of the election from CPI-(M)'s state chief: "The results show that the autocratic forces are still strong in Tamil Nadu".

KERALA

Popular Support for Police Agitation

K T Zacharias

IN Kerala the CRP strike has been total. It thus may be the high water-mark of the agitation being conducted by the various para-military forces in the state. Various Service organisations and school and college teachers are also agitating at the same time. The revolt of the man-in-uniform in this state has to be seen against the background of strikes and struggles of policemen which started in Punjab and have spread to all other states. It certainly marks a new era in the history of the para-military forces in this state as well as in all India.

In Kerala, a significant feature has been the unprecedented fraternisation between the police and para-military forces and the democratic forces in the state. The Marxist-led youth organisation was first to come out in open support of the striking men. They demanded that the Chief Minister intervene at the Centre to bring about a settlement. Then came support from the student wing of the CPI(M), followed by that of the CPI. The CPI(M) state secretary asked the Chief Minister to intervene in the matter. CITU, AITU and later UTUC — and in some places INTUC also — have come out with statements and joint meetings and demonstrations. The SFI and AISF conducted a one-day sympathetic strike.

There are two CRP battalions and one Group Centre in Kerala. The 15th Battalion is encamped at Pallipuram, 19 km to the north of the city. The 56th Battalion is at Palayam, in the heart of the city. A number of Groups are posted at a score or so 'sensitive' spots in the state. The total number of men is about 2,500. They come from UP, Bihar, Punjab and Kerala. The strike in Kerala took place a day ahead of the proposed all-India struggle. The provocation came from the authorities themselves. Two leaders of the CRP men from Pallipuram, E C Pant and Pannoose, had gone to the Palayam camp on June 20 in the evening. It is alleged that there they were taken into custody and beaten up. As in Delhi, the striking men here have paid bitterly: 438 of their colleagues have been dismissed, though the strike was completely peaceful and disciplined. Even the taking over of the camps, the armoury, and the quarter-guard was peaceful. The army men, specially airlifted for the purpose from Hyderabad, handled the situation tactfully. One of the CRP man said: "We are not fighting the government; we are only demanding better service conditions".

Nandanan, Secretary of the All-India CRP Association, in a statement has characterised the CRP camps as "concentration camps", where "worse than slavery exists". The men have even to wash the underwears of the officers and their mem Sahebs. The behaviour of Pallipuram Commandant and Palayam Camp Deputy Commandant is cited as the most unbearable.

The striking CRP men have been living in the Pallipuram camp. A very small proportion has reported for duty. There is a move to evict the dismissed CRP men from the camps and then to deal with the situation. The CRP men are angry that the Chief Minister has not intervened on their behalf. They, of course, recall how, in 1969-71, after the present ruling front camp to power, they had to stand by it against the CPI(M) protest movement. During that period, next to East Bengal, CRP was used most of all in Kerala.

Along with the CRP, CISF is on the path of struggle. Following the arrest of their leaders who had gone to New Delhi for negotiations, the Industrial Security Force at Cochin Harbour and Shipyard, at Udyogmandal, and at the Space Centre at Trivandrum, had come out on the streets voicing their demands. The strength of the CISF men is less than 1,800. They have all

been disarmed. After the events in Bokaro and Delhi, the CISF and CRP staged protest demonstrations in Trivandrum. Both had trekked all the way to the city. They were greeted on the way by student, youth, and worker groups. A demonstration by the forces of suppression receiving such popular support is unprecedented in the history of Trivandrum.

The unrest among the Kerala police has not subsided yet. Following the strike in Punjab, Kerala government announced a wage increase on June 3. But the police were not satisfied. Posters appeared declaring a strike from June 15. The prison guards at Trivandrum and Viyyur Central Jails observed a Demands Day. The excise guards held a one-day dharna in front of the Secretariat. The demands of the excise guards are said to be under consideration. On June 13, the government announced fresh concessions to the police, makig a total monthly increase of Rs 66 in their wages.

Posters have nevertheless appeared that the police will go on strike from July 4. On that day begins the state-wide joint strike of the service organisations and the college and school teachers. Irrespective of whether the police goes on strike or not, it is now evident that the government will not be able to use the 'men-in-uniform' to suppress the struggle.

PUNJAB

Murder of a Naxalite

Amarjit Chandan

ON February 9 this year, a badly-mutilated dead human body was found lying in the fields of Chhapa village in Barnala tehsil of Sangrur district. Its head was chopped off, right leg was missing, the face and a part of left thigh (where dandy Punjabi youth get tattooed peahens) was burnt Near the body were a bicycle, a pair of shoes, an empty liquor bottle, a cartridge-belt and some burnt clothes.

Whose was this body? Who was the murderer? The Punjab police responsible for murdering more than ninety communist revolutionaries during 1969-1975 in contrived encountres, with all their customary indifference say that they do not know anything. A report lodged in Malerkotla police station by one Darshan, a landlord of Dadahur village, says that on the night of February 8, two persons, Tahal Singh and Bira, attacked his liquor shop with fire-arms and that they escaped with some cash, a bicycle and a few bottles of booze.

But an association for democratic rights, the Jamhuri Adhikar Sabha, Punjab (JAS), on the basis of the report of a five-member probe-committee recently released by it, asserts that the murdered man was none but Tahal Singh, a harijan of 45 and a Naxalite activist of Dadahur village of Sangrur district.

The committee, comprising Jaswant Singh Kanwal, the Punjabi novelist, Jagmohan Singh, former general secretary of the Punjab Agricultural University Teachers' Association, Dharam Vir, physician and general secretary of the JAS, and two other college lecturers, after touring a dozen villages and recording evidence of 70 persons including Tahal Singh's dish-washer widow, relatives, village-folks and the Dadahur panchayat, and going through the postmortem report and relevant police record established the fact that Tahal Singh's murder had been well planned by landlords with the tacit support of the police. The murder was allegedly committed by two notorious elements of Dadahur — Darshan and Nahar. Ten years back Tahal Singh along with another Naxalite of the village Piara Singh (who was later murdered by the police) had challenged the authority of these elements by organising landless labourers Tahal Singh was implicated in murder cases, he was tried and he had to go underground again after his acquittal.

It may be recalled that Dadahur, which lies in the traditional Punjabi 'red-belt', was the main target of white terror in the early seventies. The then IG of Police of Punjab had personally carried the operation of razing Naxalite's houses to the ground, destroying crops and beating up people of Dadahur. Moreover the largest number of Naxalites killed in Punjab during 1969-75 belonged to the Sangrur district.

Tahal Singh's body was mutilated in order to destroy his identification marks and hamper the investigation at the very initial stage. The police did not bother to inform the kith and kin of Tahal Singh for identification in spite of the fact that the bicycle alleged to be taken away by Tahal Singh in the dacoity drama a night before had been found near the body of the deceased — a fact confirmed by the police. It was a deliberate attempt on the part of the police not to use the cycle link in establishing the identity and for further investigation. In fact Tahal Singh was already a captive of his murderers, when the dacoity drama was enacted.

The Tahal Singh murder is a pointer to the Punjab police's changed tactics for eliminating communist revolutionaries. The oft-repeated demands for judicial probes into such incidents naturally continue to fall on deaf ears.

Voltas

VOLTAS' board has approved the amalgamation into Voltas, effective from July 1, 1979, of Tata Merlin and Gerin, National Electrical Industries and Wandleside National Conductors, according to the schemes of amalgamation approved by the boards of the three companies. The amalgamations will be subject to the approval of the appropriate authorities, financial institutions, shareholders and creditors. The amalgamations are also subject to a suitable declaration by the Central government, under section 72A of the Income Tax Act, allowing Voltas to set off the losses of Tata Merlin and Gerin and National Electrical Industries. The shareholders of the companies to be amalgamated are to be paid on the basis of the valuation of their shares made by the auditors of Voltas (who are also the auditors of NEI and of WNC) and who have taken into account both the current value of the assets of TMG and NEI as well as the benefits of tax set-off accruing to Voltas as a result of the amalgamations. The fair values of the shares of the companies to be amalgamated, as assessed by the auditors, are as given in brackets against each. TMG's Rs 100 share (Rs 20), NEI's Rs 100 preference share (Rs 60) and Rs 50 equity share (Rs 5), and WNC's Rs 100 share (Rs 100). It is intended that the shareholders of TMG and NEI should receive to the extent of 75 per cent of the value of their shares by way of 11 per cent secured debentures of Voltas and to the extent of 25 per cent by was of shares of Voltas which, for this purpose, will be valued Rs 150.

TEA

Sinister Goings-On

THERE has always been an element of mystery in the government's decision to allow non-resident shareholders to have 74 per cent of the equity capital in Indianised tea companies whereas in most other industries, the ceiling under the Fera norms is 40 per cent. Since the official spokesmen have never cared to spell out the reasons, it is presumed that matters of high policy are involved which they, in their wisdom, have chosen not to share with the common public. The common public, in its foolishness, has concluded that the decision must have brought some material benefit to at least some of the decision-makers, whose interest and the country's are often regarded as being synonymous.

But the foreign shareholders must have been grateful for the consideration shown by the people who have come to assume the onerous responsibility of giving the country a touch of real economic independence. For the foreigners, the whole thing has worked out wonderfully well. The rules allow them to have the cake and eat it too. They have put their hand-picked trusted men at the helm of the successor Indian companies; they have not even spent their own money in buying the shares of these companies but have merely converted part of the proceeds accruing to them from the sale of the erstwhile foreign concerns as loans to the new units formed with Indian registration. All in all, nothing would have served their interest more nicely.

And they have not stopped here. While in India, the newly-formed Indian companies are all supposed to have an independent identity, in Britain some of the leading companies holding 74 per cent of the shares in the Indian units are merging or coming under the control of a handful of enterprising Britishers. The result is that some of these British conglomerates are now coming to secure virtual control of large chunks of the investment in the Indian tea industry. If only some of the wise people of New Delhi cared to look a bit deeply into the emerging patterns of corporate expansionism among some British companies in plantation industries, they could have seen how new monopolies, with their roots in faraway Britain, are emerging in the Indian tea sector. Each of the new Indian tea companies is having its own group of non-resident shareholders, but on one plane they all seem to converage at some points.

But this is not the only aspect of the tea industry for which the bosses at New Delhi may spare some thought. An equally sinister development is now taking place in another pivotal section of the tea trade — broking. The problems here have been brewing for quite some time, but they recently came to a head when one of those typical get-rich-quick charlatans that the tea industry has now produced chose to have a go and acquired the control of a leading broking firm. Its former owners had in a playboyish flush put their fingers in too many pies, soon found themselves out of their depth and had to save themselves by parting with control of the broking company.

But the Brahmins of the tea industry did not view the entry of the outsider with favour. Much of the 100-year-old tea trade is run on trust. The producers hand over their tea to the brokers for auctioning; the brokers take charge of the consignment, store it, auction it and pay the proceeds to the producers. And for all this, the brokers collect a small commission. But when this new management failed even to pay up the producers' dues in time, the market immediately took note of it and its fears about the changeover were deepened. The new management is now desperately working on a salvage plan, but its fate remains open.

While this case has expectedly evoked considerable interest in tea circles, what some of the more illustrious members in the broking trade are doing is no less controversial. Perhaps the least of their irregularities is that they disregard with total impunity the convention that broking firms should not have any other type of interest in the tea industry. Members of their boards sit on the boards of many tea companies. It also perhaps does not look odd any longer that the top of the small-sized brokers community should be handling between them over 60 per cent of the total business. And all the broker companies, seizing upon the loopholes in the law, have continued to remain private limited companies while their business turnover amounts to crores and crores of rupees.

But perhaps the most shocking part is the growing tendency among a section of the broking community to adopt questionable means to widen their business. One of the commonest methods now being followed is to advance money to the less affluent garden-owners, now increasingly facing the bank credit crunch, and thereby book the produce of these estates in advance. It is in a sense a somewhat sophisticated version of the "dadan" system which, we are given to understand, often denies the producer his rightful returns. In tea, the price is determined by bids at the auction sales; even then, there are a lot of details, like valuing the tea for sale where the brokers are supreme.

Another curious going-on in the trade concerns samples. Samples are distributed by brokers among buyers to help them make up their mind before the sale date. In all, about Rs 6 crores worth of samples are distributed in a year. But very often, the money that different companies make by selling the samples — which, in any case they are not supposed to do — are often not properly accounted for in their books. The West Bengal government has initiated a probe into this matter. In the meantime, the "brown sahebs" who have stepped into the tea companies' higher echelons get their "sample allowance", if only to spend it at the races or clubs.

Curiously, all this goes on and on. The government's own tea trading company has not been able to make the least difference to this pattern. If anything, it seems to have only docilely submitted to it. Tea Trading Corporation of India is being actively, and rightly, pushed by the government and its foreign embassies to handle more and more foreign business. Its sales figure is on the rise, and its profit is also growing. But certainly, the idea has never been that the business that it secures should be farmed out among private companies (one of which still has considerable foreign holding and another has, to say the least, a very dubious business image) with the corporation first content with drawing the cash compensatory allowance? What is the stake of the private "sub-contractors" to put their best to build TTCI's image abroad? Their main interest is their profit, and they leave the rest to the Corporation. And this also goes on and on.

LABOUR

Struggle against an Emergency Legacy

THE police firing on workers at Bajaj Auto, Pune, on June 17 has set off a wave of protest which is still continuing. The firing itself came on top of a lengthy agitation against an increase in work-load. The company is the largest in the Bajaj group. Set up in a collaboration with the Italian company Pigotti, it produces scooters that are sold not only in India but also in Africa and Asia. Of course, the foreign principal reserves for itself the European market with the new self-starter scooters that reduce both oil consumption and reduction.

The company has an installed capacity of 2 lakh scooters per year, besides three-wheelers. In the Emergency period the work-loads were arbitrarily increased. Despite the detention of their union leader, Rupmaya Chatterjee of Poona Workers' Federation, and despite the general atmosphere of 'emergency' repression the workers had carried out a tool-down strike. After the withdrawal of the Emergency, the workers carried forward the struggle against the increased work-load and demanded that it should be brought back to the pre-Emergency level. A 45-day strike in July-September 1978 was withdrawn after the management agreed to discuss the matter when settling the new charter of demands. At the same time notices were served on three leaders of the strike. When these three were suspended the workers again went on a strike. One of the leaders of this strike was also suspended, leading to yet another protest, this time a tool-down.

In March 1979 the old agreement expired and discussions were to begin on the new charter. The management now dismissed two of the suspended workers. The management further announced that unless the productivity norms fixed by the company were accepted, there would be no discussion on any of the union's demands. The refusal of management to carry on negotiations led to further protests. For an hour every day the workers carried on a tool-down strike. When the union leader Rupmaya Chatterjee was contacted by the management he said that his union was not conducting the tool-down, that it was a spontaneous affair. On this two of the leaders were given memos on June 16. The workers protested against this with a tool-down strike. The police were called. As they came right into the factory premises, there was a clash in which many persons were injured.

That same day the Maharashtra government declared a five-day closure of all industry, due to the power crisis. The next morning when the workers came to punch their cards, the police who had been reinforced, refused to allow the workers in After a while they agreed to let them in ten at a time! As this would have taken many hours, the workers insisted on entering the factory in the normal manner. On this there was again a clash with the police lathi-charging and tear-gassing. When even this failed to subdue the workers, the police opened fire killing three persons — two workers and a shopkeeper. As news of this firing spread there were immediate protests. The municipal workers who had only that day gone back to work after an eight-day strike immediately struck work in protest. In some factories that were running, like Silverbrite, there was a protest strike. More than 4,000 workers attended the funeral of the killed workers. The next day the shopkeepers of Pimpri-Chinchwad area observed a bandh.

Union Minister Mohan Dharia admitted that the incident could have been avoided and that a judicial enquiry should be held. The Maharashtra government, however, hesitated as the industrialists of the area brought pressure to bear on it. They alleged that the agitation was the work of elements who had no faith in the government. In a situation where even members of the cabinet do not have faith in the government, it will be difficult to find any common people who do have faith in the government!

Chief Minister Sharad Pawar held the firing to be justified. The industrialists claimed that a judicial enquiry would 'demoralise' the people. Soon after, the newly-formed Police Mitra Mandal threatened that if a judicial enquiry was held, all 85 policemen of the Chinchwad police station would resign.

The workers replied to all this with a massive demonstration of 10,000. With this the government was forced to order a judicial enquiry. The workers' anger has, however, not been stilled by the instituting of an enquiry. They know of many such enquiries in the past. Some unions are demanding that the inspector of police concerned, who has been connected with a number of incidents of police repression in the area (at David Brown Greaves, SKF, Garware, Nav Nagar Palika, etc) should be dismissed. They are insistent that they will not aceept a mere transfer.

The factories remain closed due to the lay-off at the time of this writing. But when the factories reopen, the agitation is likely to pick up.

ZAIRE

Lull before Storm?

Rajen Harshe

AFRICAN states like the Ivory Coast, Gabon, Senegal and Togo which had sent their troops to Zaire last year to protect the Mobutu regime from the 'Shaba rebels' have begun withdrawing their forces. Morocco, one of the foremost defenders of Mobutu's regime, would also be withdrawing its troops within three months after June.

Zaire is at the cross-roads of Africa. It provides a link between explosive southern region comprising South Africa, Rhodesia and Namibia and other states of sub-Saharan Africa. Its Shaba province (formerly Katanga), bordering Angola, is rich in mineral resources and accounts for three-fourths of the country's foreign exchange earnings.

Shaba has a history of secessionist movements. During early 1960s under Moise Tshombe's leadership, the province had made an abortive bid to break away. With the defeat of the secessionist forces, the Katangan gendarmes fled to Angola. A year later, when Moise Tshombe became the prime minister of the country, he tried to organise Katangans but within a short period he was himself overthrown.

After Mobutu's advent to power in 1965, some Katangan units again fled to Angola. The Portuguese colonialists gave them asylum on condition that they helped Portugal in containing the nationalist forces in that colony. The Katangans fought on the Portguese side till the Caetano government was

overthrown in Portugal by a military coup in April 1974. Later, during the civil war in Angola, Katangan units supported the MPLA (Popular Movement for the Liberation of Angola), while the other two factions (FNLA, National Front for Liberation of Angola, and UNITA, National Union for the Total Independence of Angola) were backed by Mobutu and the West. Katangan units helped the MPLA in capturing the strategically important city of Luso on the Beneguela railway line.

The Shaba insurgencies of March 1977 and May 1978 have to be seen in the light of the relationship between Angola and Zaire. The Katangans had by then established a 'progressive revolutionary movement' called Front for National Liberation of Congo (FLNC) whose aim was to overthrow the corrupt and inefficient regime of Mobutu. In March 1977 the FLNC insurgents were moving across the southern borders of Zaire getting into and out of Angola. A large number of these insurgents belonged to the Lunda tribal group and Lunda population of Shaba aided them considerably in their infiltration. Again, in May 1978, roughly 4,000 armed insurgents entered Shaba from Angola *via* Zambia and attempted to seize the copper-mining centre of Kolwezi.

There have been two versions of these events: the Zaire government version, and that of the opposition groups. While Mobutu accused Soviet Union and Cuba of training these former Katangan gendarmes on the Angola soil to invade Shaba with a view to securing its secession, the FLNC denied any secessionist designs and FLNC leader Nathniel Mbumba reiterated that the insurgents' aim was to oust Mobutu.

During Shaba crisis, there was some sense in describing the Mobutu regime as 'chaotic'. With its economy in a shambles, Zaire had become a debt-ridden country, and the government was holding discussions with private foreign creditors, particularly the Citibank, to obtain a moratorium on debts amounting to $ 700 million. Earlier, in February 1977, the country's foreign creditors had gone ahead with an additional loan of $ 250 million which they tied to strict control (by themselves) of the country's economic policies. Faced with such worsening of economic conditions and the threats from insurgents Mobutu decided to seek armed support from friendly countries in Europe and Africa.

The strategic importance of Zaire has always prompted the US to maintain close and friendly relations with the Mobutu regime. In spite of this the US avoided any direct military involvement during both the Shaba crises. Instead, the US assisted France and Belgium which decided to support Mobutu with direct military intervention in airlifting men and material. Belgium, the 'ex' colonial power and France, deeply involved in African affairs even after decolonisation, were 'natural' candidates for such intervention.

Amongst the African countries joining the Zaire expeditionary force, Morocco's involvement has been the greatest. It not merely co-operated with France but also mobilised a number of other African states to rally round Franco-Belgium-Moroccan operations. The reason for Morocco's zealous support to Mobutu was that it saw some kind of affinity between its domestic problems and those of Zaire. Just as his counterpart, Hassan II of Morocco has been involved in suppressing the liberation struggle in Western Sahara led by Polisario. Also, by participating in the war, Hassan II could divert the attention of his people from the grave economic crisis the country was facing.

Just after the first Shaba crisis, Morocco and France took the initiative in organising the conference of Francophone states in April 1977. These Francophone states were all clamouring for the 'right to security', and even the so-called radical states such as Guinea and Benin refrained from condemning French intervention in Zaire. After the second Shaba crisis, yet another Franco-African Summit was held in June 1978 during which the position of twenty moderate states on Shaba became clear. Omar Bongo, the president of Gabon and the then chairman of the OAU publicly supported the idea of an African intervention force and the Togo president, Eyadema, went to the extent of suggesting that France should help set-up such a Pan-African fighting force by providing necessary training and weapons. These two conferences highlighted the pre-eminence of France in Africa on the one hand and the fear of likely secessionist movements on the other hand.

Finally, Soviet support to Angola and Cuban involvement in Zaire affected the attitudes of important Afro-Arab countries like Sudan and Egypt (and also China). In a way, Soviet policy towards Ethiopia, Somalia and Libya drove Egypt and Sudan to Mobutu's side.

The internationalisation of the domestic problems of Zaire offers but one example of kaleidoscopic alignments and realignments among African and non-African states. Since the politico-legal boundaries rarely coincide with ethnic or national boundaries in Africa, outbursts of separatist strifes such as Biafra, Katanga, Eritrea, and Western Sahara have been frequent. The urge of African states to build up an African interventionist force also stems from this anxiety. Because such force is at present not in existence, secessionist strife invariably tends to draw the 'ex' metropolitan countries to reassert their influence in Africa. The undercurrents of rivalry for influence between the superpowers are also reflected in the troubles emanating from the secessionist movements. This seriously damages African unity. African states, divided on the issues, line up against each other with the help of major world powers and endeavour to solve their problems with military confrontation.

Zaire has always divided the African states in the past. In fact, the Congo crisis of 1960 had accelerated the formation of Casablanca and Monrovia groups. Ever since independence, Zaire has repeatedly faced the threat of disintegration. In the recent Shaba crisis Mobutu could effectively marshall his diplomatic talents and surround himself with a wide range of supporters to retain himself in power. With the rapprochement between Angola and Zaire in July 1978 and the relative improvement in the country's internal situation, the African troops are now preparing to withdraw from Zaire. What is however still uncertain is whether this withdrawal means that Mobutu's regime is out of danger or whether it marks only a momentary lull before yet another storm.

Company Meeting : Hindustan Lever Limited.

A COMPANY OF PEOPLE

Speech delivered by T. Thomas, Chairman, at the Annual General Meeting of Hindustan Lever Limited, held at Bombay on Thursday, 28th June 1979.

I INTRODUCTION

The popular image of a company like ours is that of a manufacturing and marketing enterprise with a variety of products. But to those like me, who work in the company and are responsible for managing it, ours is a company of people The biggest and most important element in a job like mine is to deal with people. Therefore, this year, I thought I would tell you something about the people who are involved with this company They are people in all parts of our country, from all walks of life, with varying levels of consciousness about their involvement in the company.

II INVESTORS

On an occasion like this AGM, I cannot help but start with the people whom I am literally facing this afternoon—the investors in our company We have over 82,000 shareholders and have thus, I believe, the distinction of having the largest number of shareholders of any company in India at present Our last share issue was one of the largest on the Indian stock market and the magnitude of response to it was a gratifying measure of confidence which the investing public has in this company. That was when the number of shareholders increased from about 16,000 to over 90,000. I must confess that we had never anticipated such a large increase and it took us a while to learn to cope with this number! We would like to thank you for being patient with us At one stage, there was an expectation that the number might drop significantly as shareholdings got consolidated, but it has remained at over 80,000.

Our shareholders are by no means rich people... 70% of them own only up to 50 shares each and 82% own only up to 100 shares each. They do take a keen interest in the company's affairs and we, as management, have responded by being as open and communicative as possible Because of the numbers and geographical spread, most communications with investors have to be through the printed word However, the AGM provides one occasion for a face-to-face dialogue with the shareholders This is the 12th AGM that I am attending as a Director or Chairman of this company, and my impression over the years has been that it has been a dialogue rather than a formal meeting. We have always allowed adequate time for shareholders to raise their questions and have sincerely attempted to respond to them immediately. Of course, this has meant that the meetings have tended to take about three hours. But it has been a worthwhile tradition to be open and communicative. We have a lively and critical audience every year, but you have also been generous with your appreciation. And we, as a Board, have learnt a lot from these meetings.

What does a shareholder expect from this company? He expects a return on his investment which is better than what he would get from investments which did not involve risks—e.g. National Savings Certificates, fixed deposits, etc. Any investment in equity of a company carries with it a measure of risk. Therefore, the return has to be correspondingly higher than from a risk-free investment. However, the risks involved in different shares can vary considerably and the investor has to make his own assessment. So, one of the first expectations of an investor is reliable information about a company and its record of performance from which the degree of risk can be assessed.

The return from fixed deposits from good companies at present is about 12% per annum. Therefore, to induce an investor to buy shares instead, a company will have to offer upward of something like a 15% dividend, unless there are other major attractions.

The other major expectation of the shareholder is growth which is required to compensate for the continuous erosion of the value of money through inflation. With an average of 7% inflation per annum, unless the dividend income from the same investment at least doubles every ten years, the investor is losing the substance of his investment. This is generally achieved through the issue of bonus shares at intervals which adds to the base capital and thereby compensates for inflation to some extent. There is a common misconception that bonus shares are some kind of windfall gain which shareholders get every few years. The truth is that it is merely one of the methods of compensating for inflation. In this respect, it is not dissimilar to the periodic revision of wage scales of employees to ensure that the real standard of living of an employee is not seriously affected in the long run as a result of inflation. The shareholder is equally entitled as the employee to protection, at least to some extent, against inflation. In our country, where capital is in short supply, the need to provide inducement to save and invest makes it even more important to protect investors in shares against inflation.

Over the years, the shareholders—especially the well-informed urban groups—and institutional shareholders have become more discerning in their assessment of a company. They look beyond the dividend and growth record and try to judge the quality of the people who manage the company. This is an important change in the expectations of Indian shareholders. In the old days, shares were taken up if some well-known industrialist or business family lent their names to the project. Although in some cases this may still be a factor, it has become generally a less important influence. This is mainly because the shareholders have become more well-informed and are able to exercise more objective judgement. In effecting this change, the community of brokers, merchant bankers, *underwriters and institutions have played a* very useful role. They are constantly analysing the performances of companies and educating investors.

Judged against the expectations of investors, we have fared reasonably well and that is why our investors stay happily with us. However, we do not seem to attract the speculators who expect dramatic returns which, in many cases, is also a reflection of the risks. We realise that it is necessary for us to continue to enjoy the confidence of our investors—individuals as well as institutions—and our policy is to build up that longerterm confidence through our conduct of the business and our dealings with the investors.

III EMPLOYEES

In the ultimate analysis, the people who make an organisation what it is will be those who work in that organisation. This is true of a family, a religious group, a political party or a company. Most large business organisations have access to finance from the same sources; they have access to similar sources of technology and they can recruit people from the same national market. And yet, their performances vary considerably. This mainly is because of the kind of people who work in the company—at all levels from the Board down to the shop floor.

There is no gainsaying the fact that it is the people, who make policy decisions regarding the direction of the company and are responsible for the execution of such policies, that can make the most significant difference to the performance of a company. One can have the most dependable source of finance, the finest of technology, the best of skilled workmen and yet perform disastrously. This was probably best illustrated by the fate of Rolls Royce in the UK a few years ago and, unfortunately, we have several examples of this in our own country too.

In this connection, I would like to bring to your attention, as shareholders, a very serious situation that is developing in our country with regard to the motivation and rewarding of this class of people in the company. Till this year, a director of a company in India could be paid Rs. 7,500 per month, certain taxable perquisites like a car and driver, furnished accommodation, servants'

salaries, leave travel and a maximum commission of half of his salary. A person who gets the maximum salary of Rs. 7,500 per month, has a take home salary of only about Rs.2,270 per month, after deduction of income tax, provident fund and 10% contribution towards house rent. Out of this Rs.2,270 per month, most people at that level would have to pay for some insurance (say Rs. 300 per month) and expenses on education of at least two children at University level (say Rs. 400 per month). That would leave Rs. 1,570 per month. From this net income, the family has to be fed and clothed and one has to meet several other obligations and responsibilities. Most of us in India have responsibilities for aged parents or a widowed sister, or aunt, or someone in the family who looks to the better-employed person for financial sustenance. In addition, we have to provide for small gifts at weddings and other festive occasions to family members, and to have as house-guests relatives from up-country. All these are obligations which we, as a nation of joint-family and community oriented people cannot ignore.

Then, of course, there is the added annual nightmare of having to find the necessary funds for Compulsory Deposit. In this case, it will probably amount to Rs. 17,300 to be found by March every year. The only source to compensate for this is the commission. On the commission of Rs. 45,000 per annum, the income tax is Rs. 32,200. Therefore, the net amount would be Rs. 12,800. That would not meet the Compulsory Deposit needs.

This, then, is the picture of the man at the top. I can assure you that it is very different from what the public has been led to believe in the recent past. In many cases, these men manage to avoid having to borrow only because they may have inherited wealth or savings from their younger days when the burdens were less.

But now let us look at a young man joining a company like ours He has done five years at an IIT and in several cases an additional two years at the Institute of Management, to take his MBA. He has an outstanding record both at the IIT and IIM and represents some of the best talent in our country. We start him as a management trainee at Rs.1,150 per month including bonus. After training of about two years, his salary will be Rs.1,470 per month including bonus. After deduction of income tax, he will get Rs. 1,390 per month. To get even a room in a city like Bombay, he will have to pay Rs. 500 per month. Most companies cannot provide accommodation. Even if the company assists him with modest accommodation, he has to pay 10% of his salary. In that case, his net salary is Rs.1,150 per month. If provident fund is also taken into account, the net salary will be further reduced to Rs.1,020 per month On this, he has to feed and clothe himself. It is hardly possible for him to save.

Now, contrast this with the income of a trader or a well-to-do farmer, or a professional lawyer, doctor, consultant engineer or accountant. In all these cases, there is no such restriction in income. Therefore, it is indeed a severe inequity to have such a restriction of salaries and perquisites of business executives. As shareholders of the company, I would like you to take note of this because if this policy continues over the years, it will become more and more difficult to attract and retain good management. And, as I said earlier, it is the quality and commitment of the management that will make all the difference to the performance of a company.

Restrictions on managerial remuneration are similar to a price control. In the last decade or so, we have seen what price control did to several industries like cement, steel, sugar, vanaspati, paper, etc. It led to shortages, black marketing, lack of investment which accentuated the shortages and an inevitable erosion in quality. I am afraid the present 'price control' on management will inevitably lead to the same situation. There will be greater tendency to evade the provisions and greater reluctance for the best people to take up professional management as a career In this situation, companies such as ours which will not indulge in any dubious practice will selectively suffer even more. I am sharing this concern with you because you have an interest in the continued growth and performance of this organisation. Let us all hope that just as in the case of other price controls, Government will find it possible to relax some of the rigidities in the existing provisions.

When I think of people in our company, the ones who stand out most in my mind are our workmen who work in night shifts in factories, people who have to work in pioneering projects, people who work in villages and rural areas to improve supply of raw materials, our salesmen who trudge around in bazars all over the country in the heat and the dust, our clerical staff who work into the late hours to reconcile their control figures, our supervisors, who have mostly come up from the ranks, and have the delicate task of interpreting to each other people who are below them and above them, the many people who provide the services that keep the operating arms going—and our managers who are almost married to the company.

There are 9,000 of us working in this company. We have 22 factories located in all parts of the country from Srinagar in the north to Coimbatore in the south, and from Shamnagar in the east to Ahmedabad and Bombay in the west From our four regional branches, our 400 salesmen cover every town over a population of 20,000 in the country—and thus, a total of 220,000 outlets in 3,660 markets. In addition, our stockists cover over 60,000 outlets in 6,500 markets through their own resources.

It is this perpetual activity in the factories and the market place by numerous individuals that keeps this company going I have often wondered in my travels and visits as to what keeps us all so committed and unified as a team. There must be many factors including some that we are not even conscious of. One of the most important factors would be the way people are treated. If they are treated with honesty and dignity, and are allowed to participate in a process of constant communication regarding the common objectives and activities, they respond with commitment. This applies to all levels whether they are workmen or directors. Therefore, a lot of time is spent by senior managers with people, listening to them, working with them, talking to them and feeling for them When I go on a tour with a salesman in Junagadh or in Assam, my entire focus is on that salesman, his effort at persuading the retailer to buy another dozen tablets of soap, or a bottle of shampoo. It is that kind of effort carried out by hundreds of them, day after day, that keeps the product moving. When the market work is over and we sit down for lunch or dinner, we invariably talk about personal problems; and in several instances these conversations have helped me gain a better insight into the feelings and aspirations of salesmen, how they have to work odd hours, how they cope with the separation from their families, how they manage to age without impairing their work, how they cope with diabetes or the expenses of marrying off a daughter, etc. On these occasions, the barriers of rank and status drop and we become ordinary human beings to each other, with similar problems and aspirations. A bit of the salesman's problems get transferred to me so that when I return to the comforts of my office, I can still feel for him and many like him.

Then again when I go to a Pan Room or an Oil Refinery, and see the people who make soap or clean a hot filterpress, I do feel for them and the physical effort that they have to put in day after day, year after year for thirty to forty years. These are men who were young with me but now are burdened with the same concerns—about sons waiting for jobs, daughters waiting to get married, wives who are in indifferent health, etc. When we talk about these things we come closer. The young man who was an athlete twenty years ago is a mature father who likes to talk about old days, as well as his present concerns. The differences in rank fall away and a human relationship is established.

In my experience, it is these human contacts which keep one sensitive and interested. Without them, one might as well be operating a huge machine.

The other major factor in evoking commitment and loyalty from people is the force of example by seniors. Unless we have total commitment to the common objectives in the top layer, all exhortations are in vain. Therefore, one of our main objectives has been to sustain this tradition of commitment and hard work at the top, which has existed in our company over decades.

Another warming feature in our company is the loyalty of people who have left the company to join other organisations or into retirement. I have often wondered and discussed with some of them as to what contributes to this continued interest and genuine loyalty to the company. The most common factors mentioned are the pride they feel in having worked in an honest and decent environment where no one asked or expected one to do anything that was mean or dishonest, and where one could feel that the people above cared.

As we grow and expand, one of our major concerns would be as to how we keep up this human and informal touch within the company, with an increasing number of employees at all levels. It will require more time and effort, especially on the part of the senior people.

Lest you think that we have uninterrupted good relations all the time and at all levels, I should add that we have our occasional

LINTAS-HLL.AGM.18-2417

differences and disputes. As a company, we believe that trade unionism is a right of our workmen, and it is to our advantage to have strong union leadership with whom management can negotiate and settle issues concerning unionised workmen. As of now, we have longterm settlements in all our major factories and they have been arrived at as a result of considerable amount of discussions with our workers. We believe bilateral settlements are much more desirable than imposed ones. Therefore, we are particularly glad that in our largest factory in Bombay, with over 4,000 people, we have recently concluded an agreement. The largeness of the numbers had made the task more difficult; but the continued personal contacts among those who work together as workmen, supervisors and managers and the ultimate belief that we have a common interest in the company have contributed to this agreement, and a similar one in our large establishment in Calcutta.

Wherever intelligent and free human beings work together, it is only natural that there will be differences of opinion and when they do occur the best we can do is to be always prepared to discuss and to be honest in one's dealings without being cowed down by threats or blackmail. In the end, it is in nobody's interest, not even that of the employees, if an organisation is not effectively managed. This realisation has to be shared by all who work in the organisation and, in our case, this seems to be a well-accepted norm.

IV THE TRADE

Another very important band of people who help in the operations of the company are our transporters, forwarding agents, stockists and retailers We have nearly 4,000 Redistribution Stockists (RSs) in all parts of the country who distribute our products through over 700,000 retail outlets. Some of them—like Khemchand Dayaljee of Poona and Ahmedabad, Bhailal Raichand of Bombay, Poonam Enterprises in Jullunder, Raj & Co. in Jorhat, Bombay Stores in Bikaner, Nala Chakravarty Chettiar in Madras, Murlidhar Jain in Bhopal—have been with the concern for more than one generation. In their case, one generation gives place to another at a slower pace than that of the Chairmen of Hindustan Lever. Therefore, you come across some of them who are constantly comparing one generation of sales managers, Directors and Chairmen with the preceding generations. They are polite enough not to give offence through comparisons unfavourable to the present generation—but their nostalgia is a kind of reminder that the bonds are older than what the present generation in the company knows. Some of them are the shrewdest traders in the country and the most well-respected ones in their own towns.

At the other end of the spectrum, you have the young, self-made, first generation stockist who has worked his way up and is still working the markets himself. For instance, there is Marwah in Kulu, who came as a boy into Himachal Pradesh with his refugee father from West Punjab. After a spell in Government service, he set himself up in business and built it up himself, trudging the valley to sell the products. Even now, he has to go by bus into the Lahul/Spiti valleys to distribute our products At the other extreme of the country, there is C.J. Thomas in Tiruvella, Kerala, who was an RS's salesman in a neighbouring town till we started a stockist's position in his town. Now he has built up his business to such an extent that financially he is better off than the Chairman of Hindustan Lever! Then, there is Jagdish, our RS in Jammu, who sold cigarettes in war-affected villages near the Pakistan border a decade ago, but is now a prosperous trader in his own right. In this younger generation, you see the resurgence of the innate trade instinct of the Indian all over again. It is not confined to one region or one community.

In our dealings with the traders, we demand honest trade practices and in return we ensure an adequate return on their capital with maximum security of business. This relationship has stood not only the test of time but also the vicissitudes like price controls, shortages, etc., and under all circumstances we have been able to ensure equitable distribution of products at fixed prices throughout the country. It is a partnership in which there is a commonality of interests and this results in a mutual loyalty which often extends beyond purely business relationships. However, one of the strictest rules we enforce is that none of our employees at any level builds up any obligation towards any trader.

While we demand a very high standard of performance and integrity from our RSs, we also strive to ensure that the business is stable and profitable for them. We believe that unless a business yields a reasonable return, it cannot be sustained. Therefore, we take care to work out the risks and profitability of our RSs to ensure that they are adequately rewarded Assistance is given to them in training their staff and improving their controls. But ultimately their success depends on the commitment they have and the quality of judgement exercised by them in their dealings with the retail trade in their town. When an RS gets into difficulty, it is usually because he has lost his touch with the market and the trade and has allowed himself to be insulated from the market. This is a temptation which befalls them as the business grows and they build up an organisation that makes the top man more remote. But in a distribution system, it is vital that the man at the top has a real and up-to-date feel of the trade. It is therefore sometimes necessary to split up the stockists' business in large towns to provide for this more intimate knowledge and contact with the market. The management of this vital distribution system is one of the valuable skills which our company has acquired over the decades. It still constitutes an important part of the training of our managers.

Although I have dealt with our distribution system in another AGM speech, the more I see of the world and the trade in many places, there is very little that can beat the combination of shrewdness, hard work, austerity and commercial judgement of the Indian trader While it is easy to criticise their behaviour at times of shortages, it has to be remembered that they are the backbone of one of the most efficient and, certainly the most economical distribution systems in the world Long may we be protected from State bureaucracy or from giant chains engaged in distribution We, as a company, are proud to be associated with our traders and in many ways we have shown them that longterm goodwill and profitability are best built up through honest dealings, as opposed to speculative ones. Companies like ours have a role to play in upgrading their skills as well as their ethics.

V SUPPLIERS

We have a diverse range of suppliers ranging from large chemical companies to the landless buffalo owners in Etah. In between, we have a large number of medium and smallscale enterprises which supply a variety of goods. Out of Rs. 46.6 crores worth of chemicals and packing materials that we bought indigenously in 1977, almost a third came from smallscale units. In many cases, we have helped either to set up the unit or to have its technology improved in order to meet our specifications. For instance, in the case of Mr. Y.H. Jhaveri of Vasu Chemicals, who is now supplying laboratory chemicals, we helped him with all technical information as well as initial guidance. In the case of Mr. Alok Nandi of Plastiko Industries, Bombay, we improved his process through our technical inputs and reduced wastage of raw materials in the manufacture of plastic containers. This helped Plastiko Industries to become more efficient and profitable. In three years, their turnover increased by 100%.

Unlike many other businesses, an important class of suppliers who deal with us are farmers and small traders—in oilseeds and milk. As we are the largest users of minor oilseeds in the country, we have in many cases to organise their collection and establish a market for them. For instance, when we discovered the qualities of sal fat for industrial use, we had to pioneer with local people in Orissa the collection of seeds from the forest, the extraction of the oil, the disposal of the cake and a host of operations associated with these primary tasks. After a few seasons, it became a regular trade and the activity was extended to other States.

Another important example has been that of our suppliers of milk in Etah. In the early stages, we were more concerned with the collection and processing of milk rather than the supply of milk. But we learned very soon that we had to get involved in the actual production and supply of milk by the farmers. It was a long and arduous learning process both for us and the farmers. But looking back, it has been a very gratifying experience for many of us and constitutes an outstanding example of how industry based on farm produce can make a significant contribution to rural development.

The primary objective of the project has been to improve agricultural productivity allround. That is the only way to increase output from animal husbandry which is an integral part of the total rural economy. Therefore our relationship with the farmers in Etah had to be extended beyond the sphere of milk supplies. As a result of our common effort, in these areas covered by our Integrated Rural Development programme, it has been possible to raise agricultural productivity by almost 30% in two years. This of course gets reflected in animal husbandry and milk output as well. The task is by no means completed. But it is another example of how one has to relate to primary suppliers and involve our organisational skills for mutual benefit.

LINTAS-HLL.AGM.1C-2417

VI CONSUMERS

In this company of people, the most numerous and perhaps also the most powerful constituency is that of the consumers. Our interphase with the consumer is over a whole range of products in all parts of India and among all strata of society—spreading from the Himalayas down to the extremities of our subcontinent.

When I was a young schoolboy in a village in Kerala, my seniors considered me too weak to be taken into the football team and it was my habit to hang around on the sidelines every evening in the hope that if there was a vacancy among the fourteen players (seven a side), I might get a chance to play. And they used to advise me, somewhat teasingly, that I should try using Dalda for health and vigour. That was almost forty years ago when Dalda was beginning to appear in the south. None of us knew then that I would end up, not only using it but, one day, making it by the tonne!

A few years ago I was in a small village called Sirsa in the Lahul Valley, between the Himalayas and the Karakoram ranges, and had gone off on a short trek. On the way back, down the slopes of the mountain, I found a woman with her baby and a calf squatting and washing the family's clothes. She was using water coming down the hill and beside her, in this most remote mountainous part, was a packet of Surf!

More recently, on a trek from Darjeeling to Sandakphu three years ago, I had stopped overnight at a goat shed at Molle, which is about 10,000 feet high and abandoned in those winter months by man and beast. As we had our evening meal, and were sitting around a bonfire, we were joined by a group of Nepali farmers wending their way from the valley down below to their remote village in Nepal. They had gone down to buy salt and household necessities. One of them was soap and the soap they had gone all the way to buy was Sunlight!

When I was visiting my home in Kerala last year, I was surprised to find that even in my small village now there was a fulltime stockist, not only for the normal consumer products but also for our animal feed. To most housewives we are the source of many products they use on a day-to-day basis. But in this town, I was surprised to see some people to whom our company was a cattle-feed company. That is a measure of the confidence and satisfaction we enjoy in diverse products and places.

Whether it is in the remotest estate of Assam, or among the camel tracks of Rajasthan, you will find our consumers—loyal and satisfied and coming back generation after generation for the old products as well as some new ones.

What does a consumer expect from us? I think her first requirement is reliability in quality. Then comes the reasonableness of the price. In spite of all the difficulties in obtaining materials and the pressures of inflation, cheap competition, etc., we have managed over the years to maintain levels of quality that are generally above that of others. We have also introduced different qualities of products for various segments of consumers so that it is within the range of each category of consumers. In times of shortages, we have spent a lot of effort disciplining the trade to ensure equitable distribution at the agreed price. One cannot claim that it was perfect but it had certainly ensured a more dependable service to the consumer whose continued confidence we have assiduously built up over the decades.

The consumer also expects from us improvements and new products. Like everything else in life, there is a desire for change. So we constantly try to improve and change—not for the sake of change but in response to a felt need or a proven improvement. This again has helped to satisfy the consumer.

And, of course, we are constantly adding to the network of our sales and distribution system to cover more and more remote parts of the country, as the years go by. The packet of Surf I saw was the result of the efforts of our enterprising distributor in Manali who takes our products once a fortnight by bus for distribution in the villages in the Lahul Valley. As years go by, we add more and more of such places to our ever-widening distribution system and thereby add more and more to this company of people.

VII CONCLUSION

What you and I are involved in is truly a company of people. Each segment has its own expectations. The investors want an attractive return on their capital, with reasonable growth and minimal risk. The employees want improved standards of living and with security and fair treatment. The trade wants adequate profits and security in their business. The suppliers want a reasonable price and honest dealings. Our consumers want the best product at the lowest possible price. Many of these objectives are evidently conflicting. And it is the job of those of us whom you have entrusted to manage this company to reconcile these different interests and to provide an optimal solution which will keep this company of people going from strength to strength and in harmony—despite the different sectoral interests and our national diversities.

(Note · This does not purport to be a report of the proceedings of the Annual General Meeting. If any shareholder wishes to have a copy of this speech in booklet form, please write to: The Communications Department, Hindustan Lever Ltd., P.O. Box 409, Bombay-400 001.)

REVIEW OF AGRICULTURE

June 1979

Review of Agriculture is published four times a year, on the last Saturday of March, June, September and December.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

Solicitude for the Rich

THE Finance Ministry has, according to press reports, decided to impose a ceiling of Rs 100 crores on expenditure on the food-for-work programme in 1979-80. In other words, the expenditure on the programme is proposed to be restricted to the level of the revised estimate for 1978-79. There has been no official pronouncement to this effect, but that there is a move on the part of the Centre to hold back the food-for-work programme is evident from recent statements of spokesmen of some of the state governments. Addressing a press conference in Calcutta last Monday, the West Bengal Finance Minister disclosed that the Centre had been unwilling to comply with West Bengal's request for release of an additional 75,000 tonnes of wheat under the programme.

The justification advanced for cutting back the food-for-work programme is truly disingenuous. The West Bengal Finance Minister has revealed that the Centre had turned down the state government's request for additional foodgrains on the ground that expansion of the food-for-work programme was likely to add to inflationary pressures. This is completely contrary to the Union Finance Minister's own statement, made while presenting the Budget for 1979-80, that any increase in expenditure on the food-for-work programme over the provision in the Budget "will .. have no inflationary impact as we will be drawing upon our accumulated stocks of foodgrains". Only a relatively small proportion of the expenditure on the programme is incurred in cash. Further, it is not as if the food-for-work programme is entirely in addition to the government's other development programmes. Thus the revised estimates for 1978-79 show that while the outlay on the food-for-work programme went up from the budgetary provision of Rs 30 crores to Rs 100 crores, that on the integrated rural development programme fell short of the budgetary provision of Rs 211 crores by 31 crores. In other words, taking advantage of the availability of food stocks as well as of the fact that the rural labour force, given its abject poverty, is in no position to demur, the Central and state governments have been substituting payment in foodgrains to labour for cash wage payments for some of their development programmes. In terms of the impact on prices, this substitution is obviously disinflationary. It is ridiculous, therefore, to make out a case for curtailing the food-for-work programme on grounds of its being inflationary. It is also patently dishonest, since horror of inflation has not come in the way of the government's massive purchase operations to keep up the prices of foodgrains for the benefit of the big farmers. These purchases are financed entirely through credit from commercial banks.

The inflation argument is sheer hocus pocus. The real reason for the government's inhibitions about the food-for-work programme is apprehension whether it might, to howsoever slight an extent, adversely affect the big farmers and traders. As the results of the Rural Labour Enquiry, 1974-75, have revealed, agricultural workers' average daily earnings in real terms *declined* quite substantially between 1964-65 and 1974-75. Such a thing could have happened during the period of the so-called green revolution only because of the existence of a large and growing reserve army of labour. Clearly, this state of affairs must not be disturbed. Central and state governments have been, therefore, ultra careful that rural employment programmes do not run any risk of pushing up wages for the big farmers, even in localised areas or for short periods. Thus in Maharashtra, for instance, work projects under the employment guarantee scheme are invariably suspended well in advance of the busy agricultural seasons. Also the wage rates that the labourers actually receive are low enough to dissuade them from bargaining for higher wages from their farmer employers. The government has also taken special care that the foodgrains distributed under the food-for-work programme do not depress market prices. Thus, for instance, the state governments have reportedly been directed by the Centre recently to raise the price of wheat distributed under the programme from Rs 100 to Rs 120 per quintal.

It is unnecessary here to go into the pros and cons of works programmes as effective instruments for generation of employment. Even if it granted that these programmes do little more than provide short-term relief for the rural poor, what is significant is that the limits to even such relief operations are set not by paucity of resources — the government's food stocks are expected to go up to a peak of 22 million tonnes this year, causing it to desperately try to export foodgrains — but by solicitude for the rich.

A Theory of Rent and Agrarian Relations

Ranjit Sau

Absolute ground rent is a hindrance to the transition from feudalism to capitalism in that it takes away a part of the surplus product of labour from being transformed into profit for capitalist development.

Agrarian revolution is the core of the current stage of the revolution in India. While it is oriented towards elimination of the vestiges of feudalism, it is not aimed against agricultural capitalism as such.

But the agrarian revolution does demand the abolition of landlordism — both feudal and capitalist. Unless the poor peasants and agricultural labourers are organised and united to carry forward the revolution to the next stage, landlordism in one form or another will reassert itself.

ABSOLUTE rent hinders the development of capitalism; private ownership of land is a hindrance to capitalism. So said Lenin in 1908, on the basis of the Marxian theory of absolute rent.[1] It is precisely the existence of private landownership that constitutes a limitation to the investment of capital and the free expansion of capital in the land. Landed property is here the barrier which does not permit any new investment of capital in hitherto uncultivated or unrented land without levying a tax, or in other words, without demanding a rent, although the land to be newly brought under cultivation may belong to a category which does not yield any differential rent. So argued Marx, in a context where 'agriculture is dominated by the capitalist mode of production', in the first place.[2] Strictly speaking, what Marx showed was that the presence of absolute rent works as a brake on the *further* development of capitalism in agriculture, which is *already* under the sway of capitalism, for it stands in the way of 'free' expansion of capital on land.

Utsa Patnaik has a different situation in mind when she says that ground rent is a deterrent to capitalist production, unless certain stringent conditions of technical change are fulfilled.[3] She refers to pre-capitalist rent, not capitalist absolute rent, as a formidable barrier to the emergence and development of capitalist production. This is easy to see. A petty producer gives away the entire amount of his surplus-product in the form of rent, whereas the capitalist farmer, in addition to that amount of rent, must earn a profit on his capital. Hence the surplus on the capitalist's farm must be sufficiently high to pay for the rent and to yield the average rate of profit. The basic reason for the high levels of pre-capitalist rent is precisely the monopoly of landed property, consequent landlessness or near-landlessness of a very high proportion of the working population, and their struggle for a livelihood within agriculture in the absence of alternative job opportunities.

Be it Marx's formulation about the antagonistic relation between absolute ground rent and *fuller development* of capitalism, or Patnaik's formulation in terms of *transition* from pre-capitalism to capitalism, in either case the presence of ground rent is a hindrance to the development of productive forces. Monopoly of landownership is a fetter on social progress. It is, therefore, understandable why at the current stage of people's democratic revolution, of which agrarian revolution is the core, feudal as well as capitalist landlordism is equally brought under attack, even though agrarian capitalism as such is not the immediate target of the revolution.

Finally, the fourth area on which the Marxian theory of ground rent sheds light is the identification of the principal contradiction. A large body of literature claims that in India today it is feudalism which is the principal contradiction. If so, then feudal rent must be one of the prominent modes of exploitation in Indian agriculture.

While the absolute ground rent plays such a critical role in the process of agrarian evolution, it is surprising that the analytical work on the theory of rent is comparatively meagre. This note is a modest attempt to prepare only a framework of analysis.

I

Rate of Exploitation

Surplus product of labour is appropriated by another class. This is exploitation. The concept of the rate of exploitation, therefore, must be cast in terms of the rate of appropriation of the surplus-product. Recall how Marx defines it: it is the ratio between the surplus-product and the necessary-product of labour-power. Here we shall define it in a slightly different way — in terms of the ratio between the surplus-product appropriated by a peasant and the surplus-product 'supplied' by him.

Suppose the peasant employs wage-labour on his farm to the tune of A labour-days, and he hires out on wages certain labour-days denoted by a; and he engages F labour-days of his family labour on his own farm. The peasant leases out some land; let B be the number of labour-days whose surplus-product is equivalent to the rent he receives on account of the leased-out land. Likewise, let b be the labour-days whose surplus-product is equal to the rent he pays on the land leased-in by him. If s is the surplus-product per unit of labour-power, then obviously he generates or 'supplies' surplus-product as measured by (F + a).s. In return, how much surplus-product does he receive? The answer is: (F + A + B — b).s. Now, *the rate of exploitation* (R) is defined as follows:

$$R = \frac{(F + A + B - b).s}{(F + a).s} - 1$$

$$\text{or } R = \frac{(A - a) + (B - b)}{F + a} \quad \ldots (1)$$

If R = 0, then the peasant does not exploit any body, nor is he exploited. A positive R means that he is an exploiter, whereas a negative R implies that he is exploited.

Mao Tse-tung, in his analysis of rural classes, mentions exploitation through rent as well as through usurious loan. If C is the labour-days whose surplus-product is comparable with the interests the peasant receives on the loan he has given to somebody, and similarly c is the labour-days corresponding to the interests he has to pay out, then equation (1) can be expanded to take them into consideration as follows:

$$R = \frac{(A - a) + (B - b) + (C - c)}{F + a} \quad \ldots (2)$$

Tables 1 and 2 give the computations of R according to (1), for two villages of Andhra Pradesh, *viz*, Kaza and Ananta Varam, in the year 1974.

Our equation (1) draws its inspiration from a similar formula of Patnaik. But, we think, Patnaik's construction is open to several questions. First, her way of calculating B and b (in our notation) is wrong. Second, her index does not really measure 'exploitation' in the Marxist sense of the term, nor

TABLE 1: CLASS STRUCTURE IN KAZA VILLAGE, ANDHRA PRADESH

Classes	Families Per Cent	Owned Land Per Cent	Agricultural Wage Labour Employed Per Cent	Agricultural Surplus Product Appropriated Per Cent	Village Income Received Per Cent	Rate of Exploitation R	Co-efficient of Relative Labour Utilisation E
Landlords	2.8	26.57	13.00	21.95	18.30	41.90	41.90
Rich peasants	10.2	31.35	46.00	38.09	20.70	3.00	3.20
Middle peasants	17.0	27.30	27.20	27.28	16.70	0.05	0.10
Poor peasants	19.8	14.77	12.70	12.68	6.40	−0.52	−2.00
Agricultural labourers	14.5	—	1.10	—	6.60	−0 90	−46.30
Others	35.7	—	—	—	31.30	—	—
Total	100.0	100.00	100.00	100.00	100.00	—	—

Note. Only the agricultural sector of the village economy is considered; the agro-related and other activities are ignored in all calculations except for those in the column 'village income received'. Land-holdings of agricultural labourers and of 'others', very small in amount, are not considered in computing the shares of 'agricultural surplus product appropriated'. However, the family labour and wage labour engaged in the family farms of agricultural labourers are included in the computation of indices R and E.

In the original data the total leased-in land exceeds the total leased-out land since some peasants have taken land on rent from outside the village. The land leased out by landlords has been distributed among the rich, middle, and poor, peasants in proportion to their respective net leased-in lands, keeping their operational holdings as they are in the original data. 'Others' are engaged mainly in government and other jobs.

TABLE 2: CLASS STRUCTURE IN ANANTA VARAM VILLAGE, ANDHRA PRADESH

Classes	Families Per Cent	Owned Land Per Cent	Agricultural Wage Labour Employed Per Cent	Agricultural Surplus Product Appropriated Per Cent	Village Income Received Per Cent	Rate of Exploitation R	Co-efficient of Relative Labour Utilisation E
Landlords	11.52	71.57	72.53	70.60	61.78	...	...
Rich peasants	18.95	18.82	21.45	21.18	21.35	6.70	6.70
Middle peasants	8.32	6.76	4.58	5.59	7.53	0.40	0.87
Poor peasants	9.86	2.85	1.44	2.63	3.69	−0.60	−2.70
Agricultural labourers	38.54	—	—	—	4.39	−1.00	−46.50
Others	12.80	—	—	—	1.25	—	—
Total	100.00	100.00	100.00	100.00	100.00	—	—

Note: See the note in Table 1.
Source: Computed from the data in Sundarayya (1977).

does it indicate 'the use of outside labour relative to the use of family labour' in any meaningful sense, her claim to the contrary notwithstanding.

To begin with, "whether rent is paid in kind or money, we can reduce it to labour days", she says (and herein lies the error), "by taking the share it forms of gross output on the leased land, as an approximation of the share of total labour-days on leased land which is appropriated through rent". Patnaik elaborates that: labour-days taken through rent is equal to (rental share to owner of land leased out) *times* (total labour days on land leased out). If rent is one-third of the produce, and 30 labour-days are engaged on the land leased out, then 10 labour days is the labour-equivalent of rent received. A similar procedure is adopted for estimating labour-days given through rent. Note that in this numerical example B = 10, since the rent is equivalent to the *total product* of 10 labour-days. (By contrast, we estimate B such that the *surplus-product* of B labour-days is equal to the rent; should the entire surplus-product of the land be extracted as rent then in our reckoning B = 30.) Now, Patnaik constructs what she calls the labour exploitation ratio (E) as given below.

$$E = \frac{(A - a) + (B - b)}{F} \quad \ldots \quad (3)$$

Suppose, for simplicity, a = 0, b = 0, and A = 25, F = 5; and, as shown above, B = 10, in Patnaik's procedure. Then E = (25 + 10)/5 = 7. But, then, a question arises: Can 25 labour-days of wage-labour hired by the peasant be added up with 10 labour-days whose total product he receives as rent on the leased-out land? We think not.

The peasant appropriates only the *surplus-product* of 25 labour-days he employs on wages; as for the other 10 labour-days in the numerator, he appropriates their *total product* in the form of rent. That is to say, A = 25 and B = 10 are not qualitatively homogeneous; A and B are not of the same dimension. Hence it is illogical to add them up. If B is expressed in terms of labour-days whose surplus-product only is taken as the unit, so that B becomes 30 in the above example, then A can be added up with B in equation (3). In that event, E = (25 + 30)/5 = 11. Evidently, Patnaik's method may give not only wrong magnitude of E, but also wrong sign.

What does the ratio of equation (3) mean, in any case? We do not feel inclined to interpret it as the ratio between the use of outside labour and inside labour. The use of wage-labour on your own farm is not the same thing as extracting the fruits of the family labour of a poor peasant on the land he has leased out from you. Qualitatively they are again two different things; they may belong to two different worlds — two different modes of production. What is the point in adding or subtracting them? They can be meaningfully, arithmetically, operated upon, once they are projected into the co-ordinate of surplus-product. From now on, we shall be referring to either (1) or (2) in the course of discussion on the rate of exploitation.

TABLE 3: RATE OF SURPLUS LABOUR AND DEGREE OF EXPLOITATION IN PRE-LIBERATION CHINA

	Rate of Surplus Labour (Per Cent)	Degree of Exploitation (Per Cent)
Yulin County, 1933		
Peasant-proprietor	19.00	—
Peasant proprietor-cum-tenant	23.94	109.00
Peasant-tenant	19.68	189.25
Peasant tenant-cum-farm labourers	20.00	134.60
Wenchiang County, 1941		
Peasant-tenant	57.30	181.00

Note: Both farm and non-farm incomes are taken into account. Rate of surplus-labour is defined as the ratio between surplus-labour and necessary labour, while the degree of exploitation is defined here as the ratio between rent paid to the landlord and the peasant's surplus-labour. Tax is ignored.

TABLE 4: INCOME, CONSUMER EXPENDITURE, AND INDEBTEDNESS OF SMALL CULTIVATORS AND WAGE EARNER HOUSEHOLD IN INDIA, 1970-71

(Rupees)

Household Type	Annual Income	Annual Consumer Expenditure	Annual Deficit	Loan Taken Per Year	Loan Repaid Per Year	Net Loan Per Year	Total Loan Outstanding at End of Year
Small cultivator	1174	1488	314	172	42	130	335
Wage earner	1196	1332	236	106	32	74	210

Source: NSS (1976).

What is the share of the surplus-product appropriated by a peasant in relation to the total surplus-product generated in the economy? The former is given by: $(F + A + B - b + C - c).s$, while the latter is given by: $\Sigma\ (F + A).s$; so that their ratio is:

$$T = \frac{F + A + B - b + C - c}{\Sigma\ (F + a)} \quad \ldots (4)$$

The summation runs over all the peasants (and landlords). Of course,

$$\Sigma A = \Sigma a, \quad \Sigma B = \Sigma b,$$

$$\Sigma C = \Sigma c; \text{ and } \quad \Sigma T = 1.$$

Computations of T for Kaza and Anantavaram villages are presented in Tables 1 and 2, respectively.

II

Exploitation in Russia and Pre-Liberation China

The peasant differentiation debate within Russia commenced by the middle of the nineteenth century, and continued right through the 1920s in the USSR. Various criteria were put forward for classifying the peasantry. In 1926 Nemchinov, for instance, attempted a synthesis of as many as eleven methodological suggestions by others.[4]

Among the studies of exploitation in pre-liberation China, that of Chen Po-ta is of certain relevance to us here. He defines the *rate of surplus-labour* as the 'ratio of income from surplus labour to the expenditure for necessary labour'.[5] The expenditure of a peasant household may be divided into two parts. (i) means of production which includes seed, fertiliser, farm tools, upkeep of livestock, and farm buildings; and (ii) means of subsistence that covers household expenses and payment to year-round or seasonal helpers. The average yearly expenditure of 16 peasant proprietor households in Yulin County in 1933 was found to be 360.94 yuan with the following breakdown:

(i) Means of production ... **100.81** yuan
(ii) Means of subsistence ... **260**.13 yuan

The average yearly income was 410.43 yuan (farm income 291.21 yuan, income from domestic occupations 96.72 yuan, and income from subsidiary occupations 22.50 yuan). Surplus labour = income minus expenditures on means of production and means of subsistence = 410.43 — 360.94 = 49.49 yuan. The rate of surplus labour is then 49.49/260.13 = 19 per cent.

The *degree of exploitation* is the ratio between the sum of rent paid to landlord, tax and other levies, on the one hand and the surplus-labour of the peasant, on the other. Table 3 shows that the degree of exploitation in pre-liberation China was more than 100 per cent; that is to say, not only the entire surplus-product but also a part of the necessary-product of the peasant were given out by him to the exploiter.

III

Rent, Profit, and Class Conflicts

Consider an agrarian economy with four classes, *viz*, landlords, capitalist farmers, poor peasants, and agricultural labourers. Landlords own land which is leased out; capitalist farmers own land, and they also lease in land; poor peasants do not own land, they only operate land that is leased in; and agricultural labourers have no land at all, they hire out their labour power. Landlords have some 'capital', in the form of money or grain, which they lend at usurious rate of interest. *Capitalists also have some 'capital'* which they invest in land in the form of constant capital and variable capital. Poor peasants operate their tenanted land only with labour-power, and no constant capital at all.

We shall keep in mind the Indian situation where the tenanted land is rather small, about one-tenth or so, of the total cultivated area. Between the capitalist farmers and poor peasants it is the former who account for bulk of the leased-in land. Poor peasants and agricultural labourers are deeply entangled in indebtedness, as displayed in *Table 4*. The total amount of loan outstanding is nearly three times the net loan taken per year, perhaps the moneylender settles the account every three years by swallowing up some assets of the debtor. Total loan outstanding at the end of the year is about the same as the annual deficit, and the net loan taken per year comes to roughly 40 per cent of the household budget deficit. It is not known how the rest of the deficit is met. On the whole, Table 4 gives a picture of perpetual and increasing indebtedness of poor peasants and agricultural labourers.

It is found that some 60 per cent of small cultivator and poor peasant households in India are indebted; and the remaining 40 per cent are *not*

indebted. The existence of non-indebted peasant households lends credence to the assumption, which will be made below, that *the rent paid by a poor peasant to the landlords is exactly equal to his surplus-product.* Note that, in pre-liberation China, rent was *more* than the *necessary-product* (Table 3). It will be further assumed that the landlord appropriates a part of the peasant's necessary-product through the mechanism of usurious grain loan.

The landlord receives rent and usurious interest; and the capitalist appropriates only surplus-product of wage-labour in the form of profit. Since the landlord does not resort to self-cultivation, it follows that for him

rent + interest $\geq$ rent + profit .. (5)

He could have invested the capital on land, instead of lending it out, and earned rest as well as profit. But he does not actually do so, in view of (5). Likewise, for the capitalist,

rent + profit $\geq$ rent + interest ... (6)

The capitalist could have leased out his land and lend out his capital, and earned rent and interest. But he does not do it, because of (6). Taking (5) and (6) into account, it can be concluded that the co-existence of landlords and capitalist farmers requires that:

profit = interest .. (7)

In the event the rate of profit is higher than the usurious interest, there would be no landlord but only capitalists; if converse, then capitalists would turn themselves into landlords. In this sense, *it is the scope of realising a relatively high rate of interest on usury that stands in the way of transition of the feudal lords into capitalist farmers.* Seen in this light, *the barrier to the development of agricultural capitalism is not the high absolute rent, but the usurious rate of interest* But this is only one side of the picture, the other side is that high ground-rent and usury go hand in hand.

How is the ground rent determined in this economy? Land is taken to be homogeneous so that the Ricardian differential rent of Type I is kept at bay. Differential rent of Type II arising out of successive investment in the same plot of land is ruled out, for simplicity. The poor peasant hands over the entire surplus-product as absolute rent to the landlord. We shall use the following notations:

q = total output in peasant's farm which has one unit of land that is leased in from the landlord;
l = labour-days (all family labour) on the peasant's farm;
s = surplus-product per labour-day;
s.l = surplus-product on the peasant's farm;
n = necessary-product per labour day;
n l = necessary-product per unit of land;
r = rent per unit of land.

Then, $q = n\,l + s\,l$ ... (8)

and $r = s.l = q - n\,l$ ... (9)

This is how rent is determined. This is the rent per unit of land which prevails in the economy, and the capitalist farmers also pay rent at this rate to the landlord.

In the beginning of the year, the peasant borrows from the landlord for his immediate subsistence. After harvest, he pays the interest, in full or in part, on debt at the end of the year. The debt burden grows. What happens as time tends to infinity? This question need not detain us. We are not building here a general equilibrium model of long-run equilibrium.

The total output per unit of land operated by the capitalist farmer is *denoted by q', and the labour-days (all* wage-labour) engaged on the land by l'. The necessary-product per labour day is the same n. So we get:

$q' = n\,l' + s'\,l' + c'$ ... (10)

where s' is the surplus-product per labour-day, and c' is the constant capital per unit of land in the capitalist farm. This q' is distributed in the following manner:

$q' = c' + n\,l' + (q - n\,l) + p$ ... (11)

since the surplus-product is split into rent and profits as under

$s'l' = (q - n\,l) + p$ ... (12)

where p is the profit per unit of land. The rate of profit (π) is given by

$\pi = p/(c' + n\,l')$ .. (13)

In view of (10), (11), (12) and (13), we get:

$$\pi = \frac{nl + (q' - q)}{c' + nl'} - 1 \quad .. (14)$$

It follows that:

$$\frac{\partial \pi}{\partial n} \gtrless 0 \text{ iff } q' - q \lesseqgtr \frac{c'l}{l'} \quad ... (15)$$

This is a very significant relation. There are two distinct phases of agricultural capitalism. In phase I, when the average product of land in the capitalist farm is either lower than that in the peasant farm, or not much higher than it, *the wage-profit curve for the capitalist farm is upward-sloping.* In this phase, then, there would be a sharp conflict between landlords and capitalist farmers; the former would try to keep the necessary-product of labour down, whereas the latter would welcome an improvement in it; for, thereby, absolute ground rent can be reduced. The birth-pang of agricultural capitalism would be severe as the landlords would spare no efforts to prevent its emergence and growth. If the Farm Management Survey data can be taken to indicate that in India the output per acre is higher in a (small) peasant farm than in a (bigger) capitalist farm,[6] then it is understandable, in the light of (15), why agricultural capitalism has to initially go through a difficult process, difficult because of the resistance of landlords to any upward tendency of agricultural wages which is, by contrast, supported by capitalist farmers.

In phase II, where the average product of land in a capitalist farm is sufficiently higher than in a peasant farm, *the wage-profit curve for the capitalist farm is downward-sloping.* Now the contradiction between labour and capital takes over. In this phase, landlords and capitalist farmers would join hand to put down any upward trend of agricultural wages.

If this analysis is correct, then there are important implications in respect of class struggle. Should a technological change lift the average land productivity of a capitalist farm well above that of a peasant farm, the battle line will be drawn between the landlords and capitalist farmers on the one hand, and the poor peasants and agricultural labourers on the other.

What is the relationship between the profit rate and the output level in a peasant farm? From (14) we get:

$$\frac{\partial \pi}{\partial q} = -\frac{1}{c' + n\,l'} \quad (16)$$

Any rise in the output in the peasant farm reduces thhe rate of profit, simply because the rent goes up in consequence. *The smaller the average output of land in the peasant farm, the better it is for the capitalist farmer.* The contradiction between the capitalist farmer and the landlord is evident from (16). The poor peasant in any case does not get any more than the necessary product.

Now, taking into account (9) and (14), we can write:

$$\pi = \frac{q' - r}{c' + n\,l'} - 1 \quad ... (17)$$

This is the equation for the *rent-profit curve.* Obviously,

$$\frac{\partial \pi}{\partial r} = -\frac{1}{c' + n\,l'} \quad ... (18)$$

Its resemblance with (16) is not surprising.

This simple model brings out in bold relief the intense conflict that rages among the classes in the countryside. The pattern of the conflict is as follows.

(1) Assuming that the wage of agricultural labourer and the necessary-product of peasant's labour are equal and concomitant (the same n appears in equations (8) and (19) above), it is found that when the average product of the capitalist farmer's land is within a well-defined neighbourhood of that in the peasant's farm (this is called Phase I), the capitalist farmer *supports* the demand for higher wages.

(2) In Phase II, when the productivity of land in the capitalist's farm is sufficiently above that in the peasant's farm, the capitalist farmer *opposes* every movement for higher wages.

(3) The capitalist farmer is always *against* any programme that is designed to increase the level of output in the peasant farm, for it leads to a rise in rent which cuts into the rate of profit.

(4) The landlord usually *resists* a tendency of the necessary product of the peasant to rise, and *welcomes* an effort to increase the average product of land in a peasant farm. However, his stand cannot always be so clear-cut, for he takes into consideration the effects on his income from usury. He reverses the above-mentioned position in case it improves the total quantum of rent *plus* interest on usury.

(5) The nature of class conflict between landlords and capitalist farmers is complex. In certain circumstances, they join hands in order to keep the wages down; but they may differ in respect of the average product of land in the peasant farm. What is most noteworthy is that *it is in the early stage of development of agricultural capitalism when the contradiction between the landlord and capitalist is the sharpest.* As the productivity of land increases substantially, their class conflict may diminish in intensity, and what is more, landlords may turn themselves into capitalist farmer in due course. On the whole, *there is a critical range in terms of relative productivity of land, between the capitalist farm and the peasant farm, in which the forces of capitalism have to struggle hard against the resistance put up by the vested interests of landlordism.* For, over this range, the tussle between wage, rent and profit, is rather acute. The process of capitalist growth may be aborted mid-way; and there may occur the *restoration of feudalism.*

IV

Transition

Does the availability of labourers at a very low wage rate inhibit capitalism in agriculture? This interesting question can be explored within the framework of the model. While, admittedly, a downward change in the wage-rate (necessary product) is not the same thing as a low wage-rate, we can get an impression of the effect of wages on rent and profit from relations (9) and (15). A low wage-rate (necessary product) improve the absolute ground-rent, but its impact on the profit rate depends upon the average productivities of land in peasant farm and in capitalist farm.

What can be unequivocally said is that absolute ground-rent is a hindrance to transition from feudalism to capitalism in that it takes away a part of the surplus-product of labour from being transformed into profit for the capitalist, and to that extent it keeps the profit rate depressed. Of the current stage of the revolution in India, agrarian revolution is the core. It is oriented towards the elimination of the vestiges of feudalism, but it is not meant to be primarily against agricultural capitalism as such. Yet, the agrarian revolution demands the abolition of both feudal landlordism and capitalist landlordism, for two reasons. First, with the ouster of landlordism of every kind the barrier to agricultural capitalism, that is, absolute ground rent, will be lowered. Second, at the same time, the redistribution of land to poor peasants and agricultural labourers will strengthen them economically. But, unless the poor peasants and agricultural labourers are organised and united to carry forward the revolution to the next stage, a poor peasant economy with all its reactionary features would thrive; differentiation of the peasantry will be intensified, and landlordism in one form or another will reappear and reassert itself.

4 Shanin (1977).
5 Chen Po-ta (1958), p 5.
6 Patnaik (1976), p A-91, says that the capitalist farm 'must operate with more advanced techniques' which is interpreted to mean that the capitalist farm must 'obtain a higher level of land productivity for the same level of labour productivity as petty producers, if direct capitalist production is to make economic sense and be at all undertaken'. This however does not necessarily mean that the actual land productivity is higher in the capitalist farm than in the peasant farm. Note that our condition (15) is in terms of relative land productivity in peasant farm and in capitalist farm.

Technological Potentialities of Peasant Agriculture

P C Joshi

Uncritical borrowing of technologies developed in the industrialised countries by the third world countries has had distorting effects on the latter's economies. This is especially so in agriculture.

This article attempts to understand the process of transformation of agriculture which accompanied the industrialisation of the now advanced economies. It underscores that, without a historical understanding of the phases and environment of that transformation, transfers of technologies to the developing countries tend to be mechanical, inequitous, and poorly integrated into the political economies of these countries.

Technology ultimately covers as wide a field as history and has, of necessity, history's slowness and ambiguities. Technology is explained by history and, in its turn, explains history, though the correlation in neither case is entirely satisfactory. This domain, co-existensive with the whole of history, does not involve one action but a multiplicity of actions and reactions and a series of interlinking cogs. It is not a linear process....

What does this mean if not that technology is sometimes the possibility which men are not capable of attaining and fully utilising, primarily for economic and social reasons, and also for psychological reasons; and at other times the ceiling which materially and technically blocks their efforts? In the latter case, when one fine day the ceiling gives away, the technical breach becomes the point of departure for a rapid acceleration. Nevertheless, the movement that overcomes the obstacle is never simple *internal* development of technology and science, or certainly not before the eighteenth century.

— Fernand Braudel,
"Capitalism and Material Life 1400-1800", London, 1973.

AN understanding of the problems of technological change in Asian agriculture is closely related to interpretations and re-interpretations of the West European Agricultural Revolution. The latter exercised a tremendous influence on all Asian countries which were late-comers to the arena of modern economic growth and which looked upto Europe as a model of modern economic growth. This influence was most pronounced in India which, among Asian countries, was perhaps exposed to direct Western impact for the longest period.

In some Asian countries, such as Japan, which escaped the colonial impact, exposure to European influence stimulated indigenous creativity in all spheres; but especially so in the field of agricultural transformation. In many other Asian countries, however, European influence created the tendency to view the problem of economic growth more as a problem of transfer of Western institutions and technologies than as one of innovations of institutions and technologies suited to the countries' own conditions. In grappling with their problems of economic development, many Asian countries have encontered formidable obstacles arising from lack of perception of the opportunities which are offered to them by their factor endowments, their indigenous technological potential, and the spectacular advances in science and technology in modern times. Among the factors obscuring the perception of the new opportunities, the most important is the absence of a conscious effort to distinguish between the transferrable and the non transferable lessons from the experience of West European countries which were pioneers in modern economic growth.

The tendency towards uncritical borrowing is reflected most sharply in agricultural policy in many Asian countries. Agriculture reflects, in the most pronounced manner, the disastrous consequences of giving greater weightage to the non-transferrable rather than to the transferrable aspects of European experience. Take the question of the economic viability and technological potentialities of peasant agriculture as a specificity of most Asian economies. The question has yet to become the central focus of thinking and investigation by Asian economists, agricultural scientists, and planners. This fact itself indicates that research workers and planners in these countries have been more imitative than creative, having no perception of fresh opportunities in solving old problems in a new way. They are still trying to solve today's and tomorrow's problems on the basis of yesterday's solutions. Serious distortions arose in agricultural planning in many Asian countries because non-transferrable lessons from the European experience were mechanically imposed on the Asian environment. More significant, however, was the phenomenon of missed opportunities resulting from the incapacity to draw the right lessons from the European experience.

In this context, attention should be drawn to several misconceptions about the European experience of modernising agriculture which are found among the elites of many Asian countries. These misconceptions have their roots in the fact that, in the past, certain phases of European experience have been treated as the totality of the European experience. Moreover, the history of European agriculture is a history of broad uniformities imposed by the physical environment to be treated as given for relatively longer periods, on the one hand, and of heterogeneities emerging as a result of continuously evolving human response to shifts in the man-land and labour-capital ratios, on the other. What was often accepted uncritically in the past, by elites of the developing countries, was a static view of technology and institutions in agriculture rather than a dynamic view. As a consequence of such rigid perceptions, a particular type of technology and a particular type of institutional framework was labelled as European, ignoring the continually evolving nature of the growth process in agriculture.

In recent years, more authentic accounts of the European growth processes and their sequences have become available — resulting in major re-interpretations of the European experience. These re-interpretations have the potential of yielding perceptions of new opportunities, even in Asian agriculture. The new insights are tending to impart a new meaning to old questions regarding possibilities and limits of technological change in Asian agriculture. They have revitalised some of the old concepts with new insights derived from more authentic and more rigorous examination of growth processes from *below* in place of more speculative and more grandiose constructions from *above*, as was done in the past. We draw attention here to

some of these new insights relevant to contemporary Asian countries such as India.

I

Specificity of Agriculture and Linkage between Agriculture and Industry

First, one must refer to the new meaning of an Industrial Revolution which now encompasses Agricultural Revolution much more explicitly and comprehensively than it did in the past. That this new meaning denotes a sharp break from past understanding becomes clear only if one appreciates that the Industrial Revolution was often misunderstood as a revolution in industry without the recognition of a thorough-going revolution in agriculture being an essential part of it. The very epithet 'industrial' seemed to dramatise the *industrial* component of the economic revolution and to obscure the importance and scope of its *agricultural* component. It was inadequately appreciated that an Agricultural Revolution was both a cause and a consequence of the classical Industrial Revolution.

Even when the linkage of industry and agriculture was conceded, the Agricultural Revolution was treated more as the fruit of an Industrial Revolution and not also as the seed of an Industrial Revolution. The two-way relationship between agricultural and industrial growth — the one being the cause as well as the effect of the other in successive phases — was not fully grasped, resulting in an underestimation of the contribution of the Agricultural Revolution to the Industrial Revolution. The very term 'revolution' as applied to agriculture seemed to suggest that this revolution represented the transition from static to dynamic agriculture in a single leap under the stimulus of the Industrial Revolution. What was missed by this sweeping and superficial view was the contribution made to transformation of traditional agriculture by a whole series of minor revolutions in the technical and economic base of agriculture for about three centuries preceding the major Agricultural Revolution, of the nineteenth century. Thus the 'industrialisation of agriculture' occurring in the nineteenth century was the acceleration of a process of agricultural change which began much earlier — rather than its dramatic beginning.

This new insight into the dynamics of the Agricultural Revolution brings to light certain basic divergences between industry and agriculture. The most important source of these divergences was that "increased output in agriculture was not, as in industry, to any significant extent, the result of mechanical innovation" (Chambers and Mingay 1966: 2). In English agriculture, for instance, "as early as 1800, the feat of releasing the latent powers of the soil on a scale that was new in human history... was not accomplished by means of a mechanical revolution" (*Ibid*: 3), but by such agricultural innovations as improvement of inherited tools and implements not directly connected with any advances in industrial technology. It would be wrong, therefore, to treat "the Agricultural Revolution as simply the counterpart of the transition to industrialism, the agrarian side of the medal of the Industrial Revolution" (*Ibid*: 2).

Such a view of the Agricultural Revolution, as a mere extension of the revolution in industry to the countryside, minimises the importance of improvements in agriculture accomplished autonomously by the dynamic elements within rural society without the support of the emerging industrial system. These improvements were the fruit of native ingenuity and skills, the result of "trial and error, of the uncanny instinct — the 'feel' of the dedicated farmer for doing the right thing with soils and plants and animals without appreciating the nature of the reasoning that lay behind their decisions" (*Ibid*: 12). These were not the fruit of modern science and technology introduced into the agricultural system from outside. To miss the indigenous character of these improvements is to overlook the role of the indigenous technological potential in the transformation from traditional to dynamic agriculture. Indeed, the concept of industrialisation as the main source of the stimulus to agricultural development in all phases leads to the underestimation of the indigenous growth potential. The experience of many Asian countries including pre-modern Japan, Thailand, Philippines, India, etc, underscores that such misconception has led to the underutilisation of native rural skills and innovativeness and to the exaggerated reliance on the highly imitative, Westernised professional classes (Shigeru Ishikawa 1970, Yujiro Hayami 1974).

The concept of agricultural development as industrialisation of agriculture is also one-sided if not erroneous because it is divorced from the peculiarities and specificities of the production process in agriculture. Agriculture presents certain complex and unique problems, both for understanding as well as for practical intervention, because the limits and possibilities set by nature are far more fundamental and powerful in the case of agriculture than in the case of industry. Agriculture is relatively more *region-bound* because of its inherent dependence on the soil and climate and on the exploitation of the regional economic potential. A particular agricultural pattern represents man's adaptation and response to the compulsions of an intricate and interlooking set of factors — like climate, weather, soils, plants and animals, social structure and, value systems achieved over a long period, covering sometimes centuries (Myrdal 1968 2121). This pattern, therefore, acquires a unique stability and sanctity, and any break from it is not easily accepted by the people who have got accustomed to it through force of habit and experience.

The region-bound character of agriculture has far-reaching implications for agricultural planning. Thus, industrial technology is far more 'transferrable' from one country to another and even from one region to another with in the same country. But agricultural technology being region-specific is far less transferrable from one country to another and even from one region to another within the same country. There is thus an inherent compulsion for *technological innovation* rather than for *technology transfer* in the case of agriculture. This implies that industrial growth is a necessary, but not a sufficient, condition for agricultural growth. It also shows why developing countries which are able to create an impressive industrial sector through imported technology are not able to create automatically the desired changes in agriculture.

In more concrete terms, the European Agricultural Revolution was primarily a revolution in an agricultural and climatic region specialising in corn production and livestock-raising. The solutions thrown up by

European agriculture are, therefore, location-specific and unique to such a climatic region and not capable of being mechanically transferred to the tropical and sub-tropical zones, especially to the predominantly rice-growing regions of Asian countries.

The history of Japanese agriculture shows, very clearly, that the first phase of adopting the European type of innovations led to failure and disappointment (Hayami 1974. 142). It was soon followed by an innovative phase of adapting technology to the specificities of the Japanese environment. It is said that, initially, the Japanese adopted the French-style army, the American style banking system, and British style cotton textile industry and agricultural methods. Later, however, modifications had to be effected in all these to suit Japanese conditions. But, in agriculture, not modifications but wholesale innovation provided the answer to Japanese problems (Gary Saxonhouse 1974: 149, Y Hayami 1974: 131-148).

The region-bound character of agriculture increases the importance of micro-level research into varieties of regional conditions and responses, to a vastly greater extent than in industry. The critical importance of this would be understood as we discuss the specific problems of technological change in agriculture. The only comment which can be made here is that the cost of ignorance of agriculture as a region-bound system, and the cost of a mechanical transfer of technologies evolved in one type of regional system to another type, is colossal in agriculture. Particularly as, because the cost-bearing capacity of agricultural producers is far less than that of industrial producers.

One of the transferrable lessons of the third phase of the Agricultural Revolution in Europe, and subsequently in Japan, is extremely relevant in this context. The emergence of a scientific and technological system, and an institutional framework supporting agriculture from outside, made a major contribution not only to raising the risk-bearing capacities of small agricultural producers but also towards the adaptation of technology to the needs of these producers — thereby enhancing their capacity to internalise this technology which was generated exogenously. Since the massive release of resources and knowhow for agriculture in the third phase was the result of industrialisation, the stimulus received from industry for agriculture was a factor of tremendous importance for agriculture in the second phase.

II

Declining Importance of Agriculture in the Course of and as a Consequence of Industrialisation

The view that agriculture loses its importance in the course of, and as a consequence of, industrialisation forms the unconscious if not the conscious premise of the thinking on problems of development in many developing countries. This premise, which has adversely affected development policies to a considerable extent in many countries, is derived from a certain misinterpretation of the European experience. The notion of decline is associated with the identification of modern economic growth with the dwarfing of the primary sector and the tertiary sectors. The latter are regarded as an index of the declining importance of agriculture. It must be explained that the new view of the Agricultural Revolution, as a Revolution having several stages and the substantial relative decline of labour force engaged in agriculture being associated with the mature phase of the Industrial Revolution, does not lend support to the notion of decline. Moreover, the relative decline of the labour force in quantitative terms should not be treated as the decline in the quantitative significance of agriculture as an economic activity. This *quantitative* decline was associated with a *quantitative* transformation of agricultural activity, converting agriculture from "a merely empirical, mechanical and self-perpetuating process employed by the least developed part of society into the conscious scientific application of agronomy" (Karl Marx 1959: 603). Thus, "at the lowest levels of productivity, each farm family is producing food for itself and half a non-farm family, whereas at the highest contemporary levels each farm family feeds itself and seven other families (W A Lewis 1963. 230)." This massive release of human and land productivity in agriculture in the course of modern economic growth is not captured by the formulation that the importance of agriculture declines in the course

of industrialisation.

Further, treating the decline in the importance of agriculture as an index of modern economic growth confuses the effect of modern economic growth with its cause. Lewis has aptly remarked that "the transfer from agriculture to other occupations, which occurs with economic growth, is the *result* and not *cause* of growth" (W A Lewis 1963: 340). Moreover, as we discuss in the next section, the relative decline of the work-force dependent on agriculture occurred in developed countries at a very advanced stage. This stage was the culmination of a process which created alternatives on a significant scale outside agriculture and which forced a break from labour-intensive methods in favour of capital-intensive methods leading to 'high-farming'. The shift in consumer demand, away from *bread* and towards *meant* and *dairy products*, was one of the major factors contributing to the drive towards 'high farming' (Chambers and Mingay: 185; 1970). For the much longer period preceding this advanced stage, even the dependence of a substantial proportion of the labour force on agriculture remained unaffected by industrialisation.

III

Shift Away from Agriculture as an Indicator of Modern Economic Growth

The contrast between the labour-scarce economy of the developed countries and the labour-surplus economy of developing countries in the contemporary world appears also as a contrast between the predominantly industrial economy of the former and the predominantly agricultural economy of the latter. This contrast looms so large in the minds of contemporary observers that it is often forgotten that *the developing countries of today show to the developed countries the image of their own past.*

The problem of agrarian overpopulation was a chronic feature of the economies of European countries for a large part of the transition from under-development to development. It must be noted that, in modern times, changes in the size and importance of the agricultural population in various parts of Europe were characterised by three main phases: the first phase showing an *increase* in population dependent on agriculture, the second showing relative *stability* of numbers in agriculture, and the third of *decline* in the agricultural population. Agrarian overpopulation in the first two phases determined the main form and direction of technological change which continued to be labour-intensive during these phases (Folke Dovring 1965: 613).

In the background of what has been stated above, it can be seen that any interpretation of modern economic growth in the light of the European experience in terms of a decline in the labour force during agricultural improvement does not distinguish between the *process* of economic growth and the *consequences* of economic growth. Recent studies have noted that "the *early* phase of the Industrial Revolution favoured labour-intensive mixed farming by offering expanding markets to agriculture which was from the modern viewpoint over-equipped with labour. The degree of industrialisation *now* attained in Western Europe — as in North America — creates a new situation in which the economics of other technical innovations takes precedence over those that created the crop rotations associated with mixed farming" (*Ibid:* 639).

The Japanese case further confirms the continuing importance of agriculture in the livelihood pattern during the industrialisation of Japan. According to T C Smith: "Owing to the intensive nature of farming, the agricultural population was almost perfectly stable from 1868 to 1940. As a result persons engaged in agriculture in Japan in 1930 accounted for 50.3 per cent of the total labour force as compared with 18.8 per cent in the United States, 16.3 per cent in Germany and 6.2 in England in 1938 (T C Smith 1959: 210). For developing countries such as India it is of great significance to know how both West European countries and Japan were able to combine an increase in agricultural productivity for a long period without a considerable decline in the proportion of population dependent on land. In both cases, this was achieved because the rationalisation of agriculture followed during all this period not the path of a labour-saving 'mechanical revolution' but of land-augmenting technological change.

In the case of Asian countries such as India there are powerful reinforcing factors like the population explosion which would maintain, even enhance, the importance of agriculture in the labour force for a considerable period of time. To quote Myrdal; "Given the two facts, of an increase in labour force which we can safely predict will continue to the end of this century and of an unchanging if not actually decreasing demand for labour caused by industrialisation, we cannot avoid coming to an important policy conclusion. This is that any realistic *agricultural policy must reckon on a tremendous increase in the agricultural labour force*" (Myrdal 1971: 416).

It is also important to take into account the paradox "of high man-land ratio co-existing with *extensive* land use and with labour-extensive rather than labour-intensive work practices in agriculture in South Asia" (Myrdal 1970: 91; 97). The proportion of economically active population is low in agriculture due to lower participation ratios. Agricultural growth, under such conditions, must first exhaust unexploited labour reserve through intensification of the labour input. This would increase the size and population of the active labour force in agriculture in the initial phase.

It is also noteworthy that, with the improvements of infrastructure and profitability of agriculture along with the urbanisation of the countryside, the traditional 'push factor' so far resulting in migration from rural areas may cease to operate and may even be transformed into a 'pull factor', leading to a restoration of the link with land and agriculture of a sizeable part of the rural population earning its livelihood in the urban areas. In fact, in the transitional period, a substantial class of part-workers-part-peasants, part-village-part-town-dwellers, may grow as a significant force

in the agriculture of countries like India in the coming years. This is a significant lesson from the history of agricultural growth of countries like Japan.

In this context technological innovations and choices require to be consciously oriented to the exploitation of this possibility of making land and agriculture bear the load of a population which continues to stay around 70 per cent of the total population as in India and which is also clamouring for shift from lower to higher incomes.

India, however, is torn between the conflicting pulls of an emerging large-farm sector which is exerting a powerful pressure in the direction of capital-intensive technological change and a vast peasant sector which is caught in the vicious circle of poverty and under-employment. The technological choices made by the dominant large-farm sector have far-reaching implications for the whole future of the peasant sector. Against this background, the importance of understanding the experience of European countries and of Japan for drawing the correct lessons from their history of technological change cannot be overemphasised.

IV

Technological Change and of Technological Choices

In recent years, numerous studies have provided a corrective to the earlier sweeping characterisation of the Agricultural Revolution in Western Europe as a single and great leap forward in the nineteenth century. They have shed new light on the character of change in agricultural technology which supports both Marshall's evolutionary conception (*"natura non facit saltum"*) as well as Marx's revolutionary interpretation ("quantity changes into quality"). The process of rationalisation of European agriculture comprises three broad but distinctly identifiable stages of technological change.

The first stage involves a rationalisation of land use — whether through *shift from communal to individualistic* land holding; through enclosures, land clearance, and afforestation; through development of covertible agriculture in place of fallow farming; through introduction of new crop systems and of crop rotations; and, in short, through the enterprise and initiative of farmers as a result of their release from the rigidities of the manorial system (Chambers and Mingay 1966; Folke Dovring 1965). Most of these changes were of a labour-intensive character and, therefore, drew upon the labour-surplus existing in the rural economy. The changes were prompted by the motive to achieve three goals: (a) greater output, (b) better qualities, (c) rescuing the crops from natural hazards such as bad weather. In the first stage of technological change the achievement of these goals called less for a mechanical revolution and more for reorganisation of the agrarian system, shifts in agricultural practices, and refinement, rather than replacement of existing tools. Another feature of this phase was that the agricultural improvements were improvised and invented largely by the dynamic landowners and farmers themselves (W A Lewis 1963: 169); Ruttan and Hayami 1971: 297; F Dovring 1965: 271). At this stage, the agricultural system was a relatively 'self-contained', not having the advantages of the breakthrough in technology achieved outside this system.

The second stage was distinguished by the linkage of industry to agriculture through the supply of industrially produced implements and inputs to agriculture. The stimulus for this was provided by the growing labour scarcity and the *need for substitution of* capital for labour and land. This resulted in the introduction of labour-saving devices, including mechanisation for coping with labour scarcity. The agricultural system became the beneficiary of the 'Engineer's Revolution' (Doreen Warriner 1969: 64) resulting in "the introduction of new implements to be drawn or driven by power" and "of motor power for drawing and driving the various heavy implements of work" (F Dovring 1965: 641). This is the stage of "high farming" meaning "intensive farming, producing the highest output per acre through the application of the recent techniques of drainage, fertilising, feeding, rotating and mechanising" (Chambers and Mingay 1966: 184). It also denoted 'high feeding' or intensive development of the four-course mixed farming system (*Ibid*: 184). A *marked characteristic of this stage was* the subordination, and in many areas erosion, of peasant agriculture by commercialised, large-scale agriculture.

The third stage of technological change is marked by major reliance on scientific research as the source of technological breakthrough in the form of 'biological chemical technology' of the third stage as contrasted with 'mechanical technology' of the second stage. It is also marked by emergence of an institutional framework of supply of inputs and credit, of marketing and irrigation management, of price regulation for support of agriculture by the state. Thus as distinguished from the 19th century agricultural expansion which occurred under *laissez faire* capitalism, the expansion in the third stage is brought about by the interventionist, welfare state. It conforms, therefore, to the model of "induced technical and institutional change (Ruttan and Hayami 1971: Doreen Warriner 1969: 34). This model is based on the shift from the sectional and localised support as in the first two phases to nation-wide and state-aided institutional support to agriculture in the third phase. In this stage, there occurs a fourfold differentiation in the institutional framework of agriculture. This framework now comprises: (a) the scientific research stations generating new technical knowledge; (b) the industrial system transforming this knowledge into new technical inputs and innovations; (c) the public or private institutions making these inputs, innovations and price support available to the agricultural producers; and (d) the associations of agricultural producers themselves *internalising* and putting them to productive use. The creation, supply and utilisation of the new technology are performed now by different sets of institutions (Ruttan and Hayami 1971).

It is important to note that this exogenous system provided powerful correctives to the tendency of earlier *laissez faire* capitalism to eject the small farmer from the economic system and to reduce him to a proletarian and a mere seller of labour power. It has also enabled agriculture to extend the possibilities and nullify the limits of technological change by transferring the cost of absorbing new techniques from the agricultural system to the institutional framework supporting agriculture from outside.

The third stage thus marks the transition of agriculture fully into the scientific age when the form, pace, and direction of technological progress in agriculture can be consciously planned and directed from above by man-made agencies as never before in human history.

It is not only the developed countries which are the beneficiaries of the scientific age. Of historical significance is the fact that the less developed countries too can benefit from this potential of science and technology. The range of choices before the less developed countries is, therefore, much

wider than it was for the European countries. They can skip a number of stages in technological evolution in order to accelerate the technological transformation of agriculture. But the important problem is of correctly *identifying the choices and the main* stages of the transition to technologically developed agriculture favourable for these countries. The new era offers possibilities not only of doing good but also of causing incalculable harm if decisions taken at the top are not based on a grasp of social realities and on the needs and interests of the majority of the tillers of the soil at the ground level. The source of danger is, as Doreen Warriner aptly remarks, "the tendency to transplant institutions (and technologies) which have been evolved in a country at an advanced stage of development to countries at much more backward stages in the belief that these have been the cause of growth and not as in fact they are the outcome of that growth; fruits rather than seeds" (Doreen Warriner 1969: 62). Institutional and technological leaps are both beneficial as well as harmful.

The contemporary European (and American) models of institutional and technological change may not be beneficial for underdeveloped countries for two basic reasons. First, countries where the surpluses from the industrial sector can finance the institutional and technological changes in agriculture are far remote in their level of development from countries where both agriculture and industry are competing for scarce investible resources. For the latter type of countries, the recipes of agricultural growth derived from the first type of countries are not very relevant because they make excessive demands on scarce capital and managerial skills which are needed for industry. Secondly, these models from Europe and America represent adaptations to very different conditions of climate, soil, crop pattern, man-land ratio etc. Having their roots in temperate climates and land-surplus economies, they are not much relevant for tropical and sub-tropical climatic zones and for land-scarce agrarian economies. Thirdly, these models reflect the interests of highly sophisticated, educated, profit-maximising and market-sensitive, large farmers rather than the survival needs of small, low-income, farmers which constitute the predominant element in Asian agriculture.

If one takes full account of the peculiarities of industrially underdeveloped and peasant-dominated Asian countries, one finds the Japanese model of agricultural growth to have much greater relevance for them with appropriate modifications than do the models of Europe and America.

There are five features of Japanese experience which are particularly relevant for many Asian countries. First, Japan made a distinction between transfer of principles of scientific agriculture, on the one hand, and the transfer of advanced agricultural technology suited to a particular country on the other. It showed greater interest in training of native talent at all levels especially local levels in these principles rather than in inviting Western experts for advice on Japanese agricultural policy. This investment in training and research enabled the Japanese to throw up Japanese scientists trained in scientific agronomy and engaged in technological innovations suited to Japanese conditions. Among Asian countries, Japan was the first to recognise the location-specific character of agricultural technology and therefore of the need for fresh scientific research in improved seed varieties, tools and techniques, irrigation methods, etc, suited to Asian countries (Hayami 1974).

The second important feature of the Japanese model was that the scientists working in laboratories and experimental plants were closely linked with dynamic landlord and peasant farmers at the village level, both interacting with each other and collaborating in adaptation and innovation of agricultural improvements. Both these enabled Japan to interpret the concept of technological leap as that of a judicious technological mix between *modern* and *indigenous* technology and between *land-augmenting* and *capital-saving* technology (Hayami 1974).

The third important feature of the Japanese model was its concept of the 'leading input' in technological change at each stage and its attempt to work out a technological path suited to the needs of small farmers. This concept of the 'leading input' kept the cost of introducing an input within manageable limits and the package of inputs was enlarged in proportion to the growth in the capacity to absorb it resulting from a higher level of development at each stage. The key to the success of Japan was in selecting irrigation as the leading input in the earlier stages. Irrigation set in motion a chain reaction making it possible to choose improved varieties of seeds and fertiliser each as leading input in successive stages and, finally, culminating in the adoption of the 'input package' at the final stage. The investment made by Japan in development of water resources and in water control and management methods provided a major thrust to technological change (Ishikawa 1967).

In the fourth place, the Japanese model combined local resource mobilisation with assistance from central funds for raising thhe investible resources for technological development. The Japanese model also combined the motivation of private gain with that of community welfare. It mobilised the collaborative effort of landlords and tenants, individual households, and community institutions, for intensifying technological change (Ishikawa 1967: 1970). Last, but not the least, another Japanese innovation was to give priority to spread of literacy and primary education among peasants rather than to higher education among the elite, which made a great contribution towards releasing the entrepreneurial spirit of the peasantry. Peasant education contributed decisively towards transferring the leadership of agricultural transformation from landlords to peasants (R P Dore 1959: 60).

The major distinction between Europe and Japan was that, while the technological advances in Europe were suited to the needs of 'high-farming', the technological choices in Japan were suited to the predominance of small holdings (T C Smith 1959: 208-209).

V

Agents of Technological Change : Large Farmers vs Small Farmers

It is important to note that recent models of agricultural development of many Asian countries, including India, draw not so much upon the relevant components of the Japanese experience as described above but upon the not-so-relevant components of the Euro-American experience. These models reproduce the high-cost 'modern science-technology' super-structure specialising much more in technology transfer from developed to backward countries than on technology innovation suited to Indian conditions. Instead of reproducing the relevant features of the first phase of the European experience (e g, land reclamation, changes in land system, improvement of crops, improvement of land utilisation practices, and labour-intensive types of agricultural improvements), they reproduce a combination of capital-intensive 'high farming' of the second phase and HYV-Fertiliser-Water technology of the third phase of the European Revolution. Indeed, this type of skipping

of stages and of advanced technology transfer suits the interests of 'the large-farmer sector' as distinguished from those of 'the small farms sector'.

The key to this tendency is provided by the fact that, while the rural economy as a whole is characterised by scarcity of land and surplus of labour, the large-farm sector considered in isolation is characterised by land surplus and labour scarcity. If from the point of view of the rural economy as a whole, land-augmenting and capital saving technologies have to be accorded the primary emphasis, the large-farm sector intensifies pressure for giving priority to labour-extensive rather than to labour-intensive methods of increasing productivity.

The question is: Why is the large farmer of today disinclined to follow the path of intensification of labour input by drawing on the labour surplus as was done by agricultural entrepreneurs in Western Europe and by 'enlightened landlords' of Japan? Several reasons explain this paradox.

In the first place, the easy availability of 'mechanical technology' with State support and subsidy is seized upon by large farmers both for status reasons and for economic reasons. Driving a tractor is status-enhancing but working with plough and bullocks is status-degrading. Secondly, there is the pressure of rising wage rates brought about by growing unionisation and legislative enactment of the minimum agricultural wages. Further, the change in social attitudes preceding a higher level of economic development in rural areas pushes rural labour townwards. Thus artificial labour-scarcity may arise in the midst of potential labour surplus as a result of conversion of rural labour surplus into urban unemployment/underemployment due to migration. This also may exert an upwards pressure on wages of agricultural labour. In the third place, as C H Hanumantha Rao points out, "the incentive for farm mechanisation is provided by the rise in prices of agricultural commodities as a result of rapid growth of population and failure of public investment in inputs like irrigation to match the growing demand for agricultural commodities. The cost of biological sources of energy in such a situation owing to the rise in the prices of foodgrains as well as to the demand for labour outstripping the supply in pockets of high agricultural growth" (C H Hanumantha Rao 1975: 35-36).

It is clear that there is a sharp divergence between the technological choices actually made under pressure from the large-farm sector and those which ought to be made with a view to promoting the interests of the small farms sector. Indeed, in the coming years, the choice between the large farmers and the small farmers as two alternative agents of technological change is bound to exercise a determining influence on both the economics and politics of agricultural transformation. The new force which has sharpened the prospect of a major confrontation between the large-farmer oriented and the small-farmer oriented perspectives of technological change is the explosion of the scientific and technological potential itself. This explosion, which has emerged as the most important feature of the contemporary world, is a major source of tension in all societies. In fact, this has altered the very definition of underdevelopment insofar as, in terms of the fast-growing technological potential as a result of scientific progress, even the developed countries begin to appear as underdeveloped in terms of the potential-actual lag (Simon Kuznets 1965: 2).

The vastly greater potential-actual lag of developing countries like India, however, is also an asset insofar as these countries can consciously use the potential of scientific knowledge for reducing the human cost of development. Unlike the Western countries who paid 'the penalty of being the *first' in the race of material progress*, the late-comers can avoid paying this penalty if they exercise their choices of technologies, institutions and ideologies more judiciously and discriminatingly (Simon Kuznets 1973: 247-258).

The explosion of scientific knowledge has vastly accentuated the contradiction between the possibility of a small farmer-oriented technological progress, on the one hand, and the impediments in exploiting this possibility created by obsolete social structures and mental habits, on the other. In this context, the question of technological choices becomes closely linked with the question of choice of motivations (profit motive *vs* collective welfare), of property arrangements (private *vs* social control over means of production), of political systems (landlord *vs* peasant power, and centralisation *vs* decentralisation of authority), and of crop patterns (food *vs* non-food and rich man's *vs* poor man's crops). But the question of technological choices poses the most formidable dilemmas in connection with the choice of human agents of technological change.

The penalty paid by the West for being the first was the heaviest in terms of the human cost involved in the misery inflicted by modernisation on the traditional peasantry (R H Tawney 1912: 230-280). Whether the Asian peasant meets the same fate in the course of modern economic growth or becomes the agent and beneficiary rather than the victim of technological change, depends on whether or not a new technological path is explored on the basis of the present explosion of scientific knowledge. In European history, the price paid for technological progress (i e, for an unprecedented growth of productive forces) was the 'immiserisation' if not 'annihilation' of the peasant, the bulwark of the pre-industrial socio-economic order (Karl Marx, Volume I: 505). In the Asian context, the challenge is not only to escape this proletarianisation/immiserisation of the peasant but to make the peasant the principal agent of reconstruction of a new economic order. In the European context, the release of the productive powers of land involved dehumanising exploitation of labour or the ruthless substitution of machines for labour. In the Asian context, the release of the creative energies of the peasant must become an essential part of the process of increase in land productivity. But, between challenge and response, between this possibility and its actual realisation, there is first the problem of *perception of the complex 'material life'* of the peasant preceding social action for its transformation into a higher order of *'economic life'* (F Braudel 1973).

If this challenge is to be met, technological change should not be dogmatically interpreted as the replacement of the old by the new, or the imposition of the new over the old, in a mechanical manner. It should be interpreted as an intermingling and interaction of the old and new technologies leading to higher levels of adjustment of man with his environment. The understanding of the patterns inherited from the past is a necessary condition for consciously deciding what requires to be rejected and what to be preserved in the old patterns. The *new* is something fixed and predetermined. The discovery of the new is a search, a creative undertaking in which the peasantry has to be mobilised as a major participant.

VI

Conclusion

The new epoch in which Asian countries have taken up the economic chal-

lenge thus puts into the centre of the stage the question of the peasantry. Within a general framework of under-development, however, the problem of the peasantry assumes diverse forms — each Asian country* exhibiting some specific feature of the problem. The specificity is related to the extent of differentiation within the peasantry brought about by the forces of commercialisation, urbanisation, cultural development, expansion of means of transport and communications, and political unification. From the point of view of the yardstick of differentiation of the peasantry, Asian countries can be classified into three major types:

(i) Under Type I, are included countries (or areas within a country) having a relatively undifferentiated or a less differentiated peasantry pitched against a class of semi-feudal landlords, moneylenders and traders.

(ii) Under Type II, are included countries (or areas within a country) having a relatively undifferentiated or a less differentiated peasantry (a) either fully emancipated from feudal and semi-feudal burdens development or (b) still passing through the stage of disintegration of semi-feudal relations of production. In other words, in Type II regions, the market-oriented large-farm sector is not yet very developed and the small and middle peasant economy is the dominant mode of production.

(iii) Under Type III, are included countries (or areas within a country) characterised by a high degree of differentiation within the peasantry, and consequently, by a relatively higher level of development of a market-oriented large-farm sector exposing the small farms sector to an unequal competition for economic resources and power.

It may be noted that, among Asian countries, mainland China and Viet Nam by and large approximated to Type I on the eve of their national liberation from colonialism and later approximated to Type II (a) after their liberation from the yoke of feudalism and before co-operativisation. It should also be noted that the agrarian systems approximating Type I and Type II and characterised by an undifferentiated or a less differentiated peasantry are generally more favourable for the collectivistic or communitarian patterns of agricultural transformation rather than agrarian systems approximating to Type III. The greater the differentiation of the peasantry, the greater the resistance to the principle of collectivism spearheaded by the commercialised peasantry. The greater the strength of the commercial motivation of the peasantry, the greater its responsiveness to the Euro-American models of agricultural transformation.

Taking a broad view of the basic characteristics of the Indian peasantry, it seems appropriate to place India neither in category I nor in category II but in category III. It should be noted that, among Asian countries, India was exposed to direct colonial rule for the longest period resulting in the disintegration of the traditional rural economy to a much greater extent than that in any other Asian country. The upshot of almost two centuries of colonial rule and three decades of freedom was the many-sided exogenous intervention in the rural economy, resulting in the loss of the traditional forms of homogeneity and the sharpening of new forms of differentiation among the peasantry. Even a cursory look at the Tables 1 and 2 reveals the importance of the large farms sector in almost all the states of India, even though there are significant variations in the *size* of the large farms sector from one group of states to another group of states. This crucial fact is often overlooked by those who offer for India in totality the Chinese or the Viet Nam variety of solutions evolved by these countries in the background of a less differentiated peasantry.

While, in the overall Asian context, India approximates Type III, one should at the same time take into account the regional variations which are very prominent in a country of subcontinental dimensions, such as India. It should not be overlooked that India's socio-economic evolution is characterised by regional unevenness to such a marked extent that, within India, one can find all the three Types at a point of time. Even Type I can be identified in selected pockets of the country and especially in the Group A states. But, as Rudra's empirical study for Eastern India reveals, Type I agrarian relationships have been sharply declining in recent years. Summarising his findings Ashok Rudra observes that "tenancy is on the decline and self-cultivation with the help of casual labourers and also sometimes farm servants is increasing". Further, "the evidence in Eastern India strongly suggests that incidence of usury as the main mode of exploitation or of bonded labour is very rare" (A Rudra 1978: 10). Rudra's findings are in sharp conflict with the findings and analyses of other scholars like Amit Bhaduri, Pradhan H Prasad, and Utsa Patnaik. On balance, however, it would be safe to identify Group A states as regions where the weight of the small peasant sector in the rural economy is still the dominant element even though the size of the large farms sector is rapidly increasing.

In sharp contrast to Group A states, the Group B states by and large approximate to Type III insofar as, in these states, the large farms sector is the leading force in technological change and agricultural transformation. Further, as Table 3 reveals, even the subsistence-oriented character of tenancy is undergoing a qualitative change in these states; tenancy is becoming commercialised. Thus, a relatively higher proportion of the tenanted area in Punjab and Haryana is leased-in not by small producers but by commercially motivated rich peasants. In contrast, the character of tenancy in eastern states like West Bengal is predominantly subsistence-oriented (P C Joshi 1974: 338-339). It is no wonder that the relative predominance of the big landholder and the big tenant has facilitated states like Punjab, Haryana, and West UP in Group A to emerge as the centres of the Green Revolution. At the same time, the scholars who see in the success of this revolution the success of the Euro-American model of technological change and agricultural transformation seem to overlook the social contradictions arising from the implementation of this model.

It is important to note that the small farms sector is still an important force in the economy of Group B states. Even though a sharp antagonism has not yet developed between the large farms sector and the small farms sector in Punjab and Haryana (Talib and Majid 1976: A-44) or in Gujarat (V S Vyas 1976: 25), the dynamics operating in the countryside of Group B states does not hold any prospect of smooth co-existence between these two sectors. For instance, it points towards the phenomenon of 'immiserisation' of the small farms sector as a consequence of the forward movement of the large farms sector (V S Vyas 1976: 30) in Gujarat. If such immiserisation has not occurred in Punjab, it is because Punjab has had some exceptional features in its evolution which are not operative in other states. In this context, technological and institutional innovations are required to protect and develop "the hard core of the small farms

sector", which as Vyas emphasises, "has come to stay" in the agriculture of Group B states (*Ibid*). The protection and development of the small farms sector in Group B states call for "the creation of an agrarian system in which both profitability and collective welfare work as complementary motivating forces for agricultural progress, and both the modern and the traditional inputs, are used effectively and in a scientific manner" (S Ishikawa 1970: 116).

The problem of technological change, however, poses the most formidable problems of technological innovation, institutional change, and shifts of political power from unproductive to productive classes in Group A states. The advocates of the Euro-American model of technological change and agricultural transformation do not seem to take full cognisance of the complexity of the agricultural situation in densely-populated Group A states where the conditions for the success of such a model are by and large non-existent. These Group A states also happen to be erstwhile permanently settled areas, which experienced the most concentrated and devastating impact of colonial policies of extraction of revenues from this region without public investments in the development of the infrastructure for growth of productive forces.

In contrast, many Group B states experienced such direct colonial impact to a lesser extent; they also benefited from such public investments in irrigation and in co-operation as were undertaken by the British under pressure from nationalist forces and as created the background for economic growth in the subsequent period. In Group A states, therefore, massive public investments in irrigation, technological innovation, and other types of infrastructure, as well as large-scale organisational effort are indispensable to break the vicious circle of stagnation and poverty. This type of mobilisation can neither be initiated nor be sustained by private initiative. It calls for a model of transformation which would have to draw heavily upon the forms of co-operation and State intervention in the field of land to the tiller, development and management of water, inputs, credit and agricultural education that have been evolved in the rice-growing rural economies of Japan, Taiwan, South Korea, mainland China and Viet Nam (Baudhayan Chattopadhyaya 1977).

The modernisation of agriculture in densely populated regions no doubt calls for technological leaps and radical institutional changes. But those advocating changes in the inherited agricultural patterns of Group A states must also recognise the very deep roots of these patterns. This is not to deny the compulsion to draw the peasant in these states into the mainstream of change and growth. But peasant's responsiveness can be won only if he is sure of a change for the better and not for a change for the worse. We began this paper with a quotation from Fernand Braudel. We conclude it with another of his observations which gives an insight into the human behaviour in the densely-populated areas!

> It is a fact that each densely-populated world has worked out a group of elementary answers and has an unfortunate tendency to stick to them because of an omnipresent *vis inertiae* which is one of the great artisans of history. So what is a civilisation if it is not an ancient settlement of a certain section of mankind in a certain place? It is a category of history, consequently a necessary classification. Mankind only shows a tendency to become one (and it has not yet succeeded) from the end of the fifteenth century. Until then, and more and more as we further go back in time, it was divided between different planets each sheltering an individual civilisation or culture, with its original features and ancient choices. However, close to each other, their solutions were never able to intermingle (F Braudel 1967: 443).

Real Wage Rates of Agricultural Labourers in Punjab, 1961-77

A Preliminary Analysis

Sheila Bhalla

This paper has two main purposes: First, to present the facts about real wage changes in Punjab, for the state as a whole, and for each district, for the period 1961 to 1977. Secondly, to measure the strength of two factors which may account for the trend: (1) the success of the Green Revolution technology in raising farm productivity, and (2) the remarkable influx of workers into the agricultural labour force.

Part I deals with real wage rates in Punjab as a whole from 1961 to 1977. Part II covers the same ground for each district separately. In Part III, the impact of rising farm productivity, and of rising prices, on real wage rates, is measured separately, for the period 1961 to 1977, for Punjab as a whole. Finally, in Part IV, the labour supply factor is brought in. The joint impact on real wages of farm productivity and number of agricultural workers, as measured by labour productivity, is examined for two trienniums — 1962 to 1965 and 1970 to 1973 — using cross-section data for each of the two periods. The paper ends with a list of questions which need to be answered in the interests of a fuller explanation of variations in real wage rates in Punjab.

I

Real Wage Rates in Punjab: 1961 to 1977

IN Punjab, between 1961 and 1977, there was a race on, between rising farm productivity, on the one hand, and an increasing labour force and inflation, on the other. The rapid growth of farm output tended to push up real wages; the growth of the labour force at rates far above the rate of growth of population[1] tended to pull real wages down The outcome, it appears, was often decided by inflation, which periodically eroded real wages to levels below even those attained in 1961

As of 1977, for Punjab as a whole, the forces of rising productivity had won. But it was a narrow victory. Over the entire period, real wages for male agricultural labourers, went up by between six per cent (for weeding), and 20 per cent (for harvesting).

The real wage data in Table 1, make it clear that in many years, the rise in money wages lagged behind price changes, leading to reduced real wage rates for most operations between 1965 and 1968, and again in 1974, 1975 and 1977. The year-to-year behaviour of real wages thus appears erratic, The forces which pushed real wage rates down during the 1960s, below 1961 levels, were finally counterbalanced by rising productivity only in 1969.

The peak real wage rates for the entire period appear in the years 1969 to 1973, inclusive. Subsequently, they fell in 1974 and 1975 to levels below those reached during the early 1960s, and well below those of the all-time peak. In 1976 and 1977, real wages recovered somewhat, but they were still below those recorded from 1969 to 1973 inclusive.

Real wage rates for ploughing, sowing, weeding, and 'other agricultural operations', all followed a similar pattern. But harvesting wages were generally more buoyant. In most years, when other wages fell, harvest wages either did not fall at all, or fell by a smaller amount. The exceptions are 1967 and 1977.

Cotton picking wages paid to women, constitute the only case where real wages are lower in 1977 than they were in the early sixties. Women's cotton picking wages started to lose ground relative to men's wages in other operations from 1964 onwards. Although their real wages rose for the three years 1967 to 1969 inclusive, they never reached the peaks of 1962 and 1963. Subsequently, they collapsed so far that, even given the upturn of the last three years, real wages for women cotton-pickers today are below those of 15 years ago.

Although male labourers have gained over the period 1961 to 1977, the

TABLE 1 : REAL WAGE RATES IN PUNJAB, BY OPERATION : 1961 TO 1977

(Rs at constant 1960-61 prices)*

Year	Ploughing	Sowing	Weeding	Harvesting	Other Agricultural Operations	Cotton Picking (Female)**
1961	2.50	2.49	2.65	2.59	2.49	2.00

4. 1963=100
5. 1966=100

increase in the real value of their wages is much smaller than the growth rate of output,[2] alone, would suggest. Output has gone up to more than two and a half times its level in 1961, but real wages have, at best, registered a rise of approximately 15 per cent.

In Table 2, the indices of agricultural production can be compared with real wage indices for each of six different operations. It can be seen that output dropped below 1961 levels in only one year — 1963. But real wages fell short of 1961 standards in several years, in the case of all operations other than harvesting.

II

Real Wage Rates in Punjab, by Districts: 1961 to 1977

Although real wage rates for every operation rose for males in Punjab as a whole, this is not the case for each district taken separately. The real wage rate indices of Table 3 show that real wage rates went up for all operations in only five districts: Amritsar, Ferozepur, Hoshiarpur, Ludhiana, and Sangrur. At the other extreme, Bhatinda and Kapurthala recorded a decline in real wage rates between 1961 and 1977 for four out of five operations.

The detailed figures for real wages by district, given in the Appendix Table 1-A, however, reveal that despite the erosion of their real wages over time, the agricultural labourers of Bhatinda remain among the best paid in the state, along with labourers in Ferozepur and Faridkot. Furthermore, despite impressive improvements over the period in Gurdaspur, Hoshiarpur, and Jullunder, real wage rates in 1977 were the lowest in Punjab state in these three districts.

The stagnation or decline of real wage rates in some districts which started out in 1961 as 'high-wage' areas, and the sharp increase in real wage rates in several districts which were among the 'low wage' areas of 1961, suggests that there may have been a convergence of real wage rates during the period. Table 4 shows that this is, indeed, the case. Inter-district wage differentials have narrowed for all operations except harvesting.

The question we now turn to is: What facts provide the best explanation for these movements in real wage rates?

TABLE 4 : CONVERGENCE OR DIVERGENCE OF REAL WAGE RATES, BY OPERATION ; INTER-DISTRICT STANDARD DEVIATIONS 1961 AND 1977

Operation	SD 1961	SD 1977	Implications
Ploughing	0.523	0.509	Convergence
Sowing	0.603	0.535	Convergence
Weeding	0.553	0.461	Convergence
Harvesting	0.479	0.850	Divergence
Other Operations	0.577	0.513	Convergence

TABLE 5 : REGRESSION RESULTS : ALL PUNJAB, 1961 TO 1971

Operation	Statistics R^2	Statistics t	Level of Significance*
Ploughing	0.25	2.23	95
Sowing	0.27	2.35	95
Weeding	0.22	1.70	Not significant
Harvesting	0 36	2.67	98
Other Operations	0.43	2.97	99

Note : * Significant at the 95 per cent level for values of t>2.131

Part B : Independent Variable : Consumer Price Index for Agricultural Labourers Dependent Variables : Real Wages for Each Operation

Operation	R^2	t	Level of Significance**
Ploughing	0.04	0.74	Not significant
Sowing	0.05	0.87	Not significant
Weeding	0.02	0.54	Not significant
Harvesting	0.12	1.39	Not significant
Other operations	0.14	1.61	Not significant

Note : ** Significant at the 95 per cent level for values of t>2 131

TABLE 6 : ESTIMATES OF LABOUR PRODUCTIVITY, BY DISTRICT 1962 TO 1965 AND 1970 TO 1973

District	1962 to 1965 (Mean) Output Per Male Worker* (Rs)	1962 to 1965 (Mean) Output Per Male Agricultural Labourer (Rs)	1970 to 1973 (Mean) Output Per Male Worker* (Rs)	1970 to 1973 (Mean) Output Per Male Agricultural Labourer (Rs)
Amritsar	2.93	14 38	3.83	10.55
Bhatinda	3 71	19 91	4 57	15.46
Ferozepur	3 65	17.26	4.88	14.92
Gurdaspur	2.38	14.69	3.36	10.34
Hoshiarpur	2.00	21 97	2 80	9.66
Jullunder	2.12	17.05	3.84	10.87
Kapurthala	3.50	170.63**	4.06	16.28
Ludhiana	5.35	111.82**	5.07	14.40
Patiala	3.21	16.78	4.27	13.23
Ropar	2.02	18.41	2.68	10.68
Sangrur	2.60	17.22	4.43	15.47

Notes : * 'Male workers' include both cultivators and agricultural labourers.
** These figures are *not* the result of misplaced decimal points, but the figure for Kapurthala is thought to be somewhat high as a result of an underestimate of male agricultural labourers. The figure for Ludhiana is correct.

III

Impact of Rising Productivity on Real Wage Rates in Punjab : 1961 to 1977

Rising farm productivity dominated all other influences on the real wage rates during the period 1961 to 1977. Between 25 per cent and 43 per cent of the year to year variations in real wages for ploughing, sowing, harvesting, and 'other operations', are explained by farm output growth alone. Thus the enhanced demand for farm labourers was the most important single influence on real wage rates during the period. The R^2 values in Table 5, Part A, indicate the degree to which this explanatory variable influenced the real wage rates for each operation.

The very low R^2 values in Part B of the same Table, together with the insignificant 't-values', show that the depressing impact of inflation on real wages, was swamped by other, more powerful forces.

The combined influence of agricultural productivity, and the labour supply factor can be measured by output per worker, or labour productivity.

Estimates of labour productivity for male cultivators and male agricultural labourers combined, and for agricultural labourers separately, are given in Table 6, by district, for the early 1960s and the early 1970s. The Table shows, first, that output per male worker (cultivators plus agricultural labourers) has risen in all districts, except Ludhiana where because the rate of growth, in agricultural workers exceeded the rate of growth of output labour productivity went down. Productivity per male agricultural labourer declined in all districts, because of the rapid influx of new entrants into the wage paid agricultural labour force, during this period.

The results of regression analysis of the cross-section data are given in Table 7. They suggest several important conclusions.

First, the variable that explains variations in real wages best, in the more recent period, is productivity per male agricultural labourer. This variable captures the impact of the two factors which have been working in opposite directions during the past decade — rising agricultural productivity, on the one hand, and the enhanced supply of wage paid labour on the other.[8] Together, these forces account for 50 per cent of the inter-district variations in real wages during the early 1970s. The 't-value' is highly significant.

Productivity per male worker for the combined set of cultivators plus agricultural labourers, in the early 1970s, accounts for a smaller proportion of the variations — only 38 per cent — and the 't-value' is significant only at the 95 per cent level.

Secondly, labour productivity explains very little of the inter-district variations

Notes. In computing the three-year averages for 1962 to 1965, the following procedure was followed in cases where the data for the period on money wages was not complete

(1) Where data was available for only one, or two years, the data for that year, or the mean of the two years was used.

(2) Where wage rate data was not available for any of the three years, estimates are given based on:

(a) 1961 and/or 1965 figures, inflated or deflated by the relevant price index, or their average taken in case both were available, and

(b) the results adjusted by the relationship between the wage rate for the operation in question, and wage rates for other operations available for the missing years.

in real wages during the early 1960s, despite its relatively great explanatory power for the 1970s. This contrast suggests that in the labour market, the forces of demand and supply acquired increasingly greater importance in the determination of real wage rates during the Green Revolution decade.

But while both of the labour productivity variables carry greater explanatory power during the 1970s, still a large part of the variations in real wages remain unexplained. The slow response of money wages to changes in the consumer price index,[4] even during the 1970s, suggests that factors affecting bargaining power, other than the labour demand and supply variables used in this analysis, may be at work.

Recent discussions[5] with leaders of Punjab peasant and agricultural labourers' organisations indicate that answers to the following questions are most likely to provide the material needed to close the gap between the 'explained' and the 'observed' inter-district variations in real agricultural wage rates.

(1) *In which districts have organisations of agricultural labourers been most active in recent years?*

(2) How important is seasonal in-migration of agricultural labour? This needs to be measured both in terms of their numbers, and the duration of their stay.

(3) To what extent have new kinds of permanent labour contracts spread in each district of Punjab? Here the underlying hypothesis is that the rise in the relative importance of such contracts tends to depress local casual labour wage-rates.

(4) To what extent have members of landless *and landed households* taken up non-agricultural jobs within the village? To what extent do they commute to nearby towns to work? Both the access of the landless to non-agricultural work and the involvement of cultivating households in it may have a positive impact on agricultural wage rates, the former through its action on the labour supply side, the latter from the demand side.

(5) From what areas have the largest numbers of artisans, craftsmen, and modern skilled labourers migrated abroad during the past five or 10 years?

These questions indicate some lines on which more intensive analysis has to proceed in the search for a fuller explanation of variations in real wage rates.

Notes

[This paper was prepared for the Seminar on Agrarian Structure and Peasant Movements in Punjab, sponsored by the School of Social Sciences, Jawaharlal Nehru University, March 22 to 24, 1979, in New Delhi. For their able computational assistance, I am greatly indebted to Ramesh Sharma, Sucha Singh, and Ajaya K Rath.]

1 Population grew at an annual compound rate of 2.2 per cent.
2 Output is valued at constant 1960-61 prices.
3 Growth rates for agricultural workers are given in Table 2-A in the Appendix.
4 This can be verified by comparing the indices of real wages in Table 2, section I, with the consumer price indices in Table 3-A, in the Appendix.
5 The Seminar on Agrarian Structure and Peasant Movements in Punjab, which was largely attended by peasant and agricultural labour leaders as well as by academics provided a unique opportunity for sharing information, impressions, and theoretical formulations.

Inter Size Group and Inter State Variations in Distribution of Agricultural Assets

H Laxminarayan

Livestock continues to be the predominant form of asset, particularly of small cultivators, for a variety of reasons. It is especially important in states where landholdings are small.

Assets held are more evenly distributed in relation to land area cultivated only for medium farmers, while they are unevenly distributed in the small and large-sized holdings. There is also uneveness among the states — asset value per hectare of land being higher in those states where the proportion of irrigated area is more, and being directly related to variations in yields per hectare.

If crop yields in backward regions are to rise, institutional reforms aimed at more even distribution of land and non-land assets appear to be as important as public investment in irrigation and fertiliser production.

IN analysing inter-size-group and inter-state variations in the pattern of asset holdings, broadly two sets of data can be used. One source is data collected by the Reserve Bank of India in the All India Debt and Investment Survey of 1971-72. The other source is data collected by the National Sample Survey in the 26th round on Census of Land Holdings. It would have been useful to compare the two estimates. Such a comparison is rendered difficult, however, for the following reasons. First, the asset data presented by the Reserve Bank of India is in value of asset groups while the NSS data is in terms of size of holdings. Secondly, the asset data presented by the National Sample Survey relates to livestock, agricultural machinery, transport equipment, and non-farm business equipment only; whereas the asset data presented by the Reserve Bank of India is much more comprehensive and includes a larger number of assets, such as land, building, durable household assets, and financial assets in addition to such other assets which have been considered by the National Sample Survey. Details relating to composition of the assets covered in the above two sources of data are given in the Appendix.

Data presented in the NSS Survey, which has been drawn upon for analysis in this paper, is in the form of information of 14 size-classes of operational holdings and relate to 1971-72. For purposes of analysis in this paper these 14 size-classes have been grouped into three size-groups, viz, upto 2.02 hactares, 2.03-10.12 hectares, and 10.13 and above hectares. Broadly, these three groups constitute small, medium and large holding groups.

Structure of Asset Holding and Size of Land Holdings

First, an attempt has been made to examine the relation between the pattern of asset holding and the size of holdings. The percentage distribution of the value of different types of assets in different size groups is shown in Table A.

The figures presented in Table A clearly indicate that livestock is the most important asset for all the size-groups, in the sense that it accounts for at least 60 per cent of the total value of assets in all size groups. The importance of livestock is typical of the agriculture in developing countries where the bulk of the farmers do not have resources to buy other assets. In order of importance, the other items are agricultural machinery, transport equipment and non-farm business equipment. Livestock is more important to smaller holdings than to other holdings, and the importance of livestock decreases with increase in the size of holdings. The importance of agricultural machinery also increases with an increase in size of holdings with large holdings accounting for nearly 28 per cent of agricultural machinery.

Smaller holdings hold a considerable part of their assets as livestock partly because they try to supplement their income from cultivation with income from other sources such as milk production. There are also other plausible reasons for this pattern of asset holding. The second explanation is that small farmers try to keep their own draught animals for purposes of cultivation, though they cannot use them fully. It is also argued that small farmers try to keep part of their asset in the form of livestock — an asset which is often sold in bad years and repurchased in good years — in order to strengthen their liquidity position, counteract uncertainty in production, and provide for adverse outcomes in consumption.[1]

Concentration of 'Assets' and Concentration of 'Land'

Now let us try to relate the value of assets held by different size-groups to concentration of land in different size-groups. Small farmers who account for nearly 35 per cent of cultivated area account for only 24 per cent of assets. On the other hand, big farmers who account for 13 per cent of land area account for as much as 24 per cent of agricultural assets. Middle farmers, who account for 51 per cent of land area, account for 52 per cent of assets. Thus, the concentration pattern of assets in relation to concentration of land seems to be more evenly distributed in the case of middle holdings. One of the reasons for

the type of imbalance mentioned here is the inability of smaller holdings to hold such assets as agricultural machinery and transport equipment. The size of their holdings does not make it viable for small holders to hold these assets. These assets are more economic to farmers who have larger holdings. The ability of small holdings to hold assets is also impaired, as they do not have easy access to cheap credit.

INTER-STATE VARIATION IN PATTERN OF ASSET HOLDINGS

At this stage, let us have a look at inter-state variations in the pattern of asset holdings. Details relating to inter-state variations in the pattern of assets held by different size-groups are given in Table 1. Table 1 clearly indicates that, as an asset, livestock is particularly important to states other than Gujarat, Haryana, Maharashtra, Punjab, Tamil Nadu and Kerala. Excepting Kerala, where livestock accounts for only 36 per cent of the value of assets, in all other states livestock accounts for at least 60 per cent of the value of assets. Low proportion of livestock in Kerala may be explained mainly by the cropping pattern. Plantation crops account for a considerable part (condiments and spices occupying 10 per cent of gross cropped area) of the cropped area. In plantation areas, the demand for

draught animals is small as very little ploughing is undertaken. Livestock is important in all states excepting Kerala for small holdings. In Assam, HP, MP and Rajasthan livestock is important even for larger holdings, thereby indicating the poor state of agriculture in these states.

For Gujarat, Haryana, Maharashtra, Punjab, Tamil Nadu and Kerala agricultural machinery is relatively more important as compared to other states, thereby indicating the relatively better-off condition of farmers in these states. The importance of machinery in the pattern of asset holding in Punjab, Haryana, Tamil Nadu, Maharashtra and Gujarat is partly due to mechanisation of agriculture and partly due to investment on irrigation equipment. However, Maharashtra and Kerala stand on a different footing because of the importance of transport equipment. Predominance of cash crops, such as plantation crops in Kerala, generates additional demand for transport equipment. Only in the case of Kerala is the non-farm business equipment important, in as much as it accounts for 24 per cent of total assets held by the cultivating households. Importance of non-farm equipment in Kerala may be explained by the supplementary occupations adopted — such as fishing — and also by

the importance of processing equipment in farms.

Bulk of the assets are concentrated in UP (20.96 per cent), Maharashtra (9.97 per cent), MP (10.56 per cent), Rajasthan (8.51 per cent) and Gujarat (8.10 per cent). This can be seen from Table 2. These five states together account for nearly 58 per cent of the value of assets. This is not surprising as these states also account for nearly 59 per cent of cultivated area. This indicates that, by and large, concentration of assets moves in the same direction as concentration of land.

Next, let us relate inter-state variation in the pattern of asset holdings to concentration of land in different states. It appears that Punjab, Haryana, Tamil Nadu, UP and Gujarat fall in one category while Rajasthan, Madhya Pradesh and Maharashtra, fall in another category. These trends can be seen from Table 3. The latter three states, *viz*, Rajasthan, Madhya Pradesh and Maharashtra, happen to be relatively bigger states accounting for 39.1 per cent of cultivated area and 29.04 per cent of assets also. On the other hand, the former five states — Punjab, Haryana, Tamil Nadu, UP and Gujarat — which account for 28 per cent of cultivated area account for 42 per cent of the assets. Thus, in relation to land area cultivated by them, the value of assets held by them indicates these five states to be more favourably situated. The disparity between these two groups of states, increases when one looks at the pattern of holding of agricultural machinery. The four smaller states, *viz*, Punjab, Haryana, Tamil Nadu and Gujarat, which account for only 14 per cent of cultivated area account for 36 per cent of the value of agricultural machinery. On the other hand, the other three states — Maharashtra, Rajasthan and MP — which account for only 29 per cent of the agricultural machinery account for 29.04 per cent of the cultivated area. This indicates relative differences in the mechanisation of agriculture.

So far we have discussed the pattern of asset holding without taking into account the per-hectare picture. Table 4 gives information on per-hectare value of different agricultural assets

in different size-groups in different states. In Table 5 we have tried to rank the states on the basis of per hectare value of assets. If we exclude livestock, Punjab Kerala, Tamil Nadu, Haryana and Gujarat are the first five states in order of importance in respect of per hectare value of assets. Karnataka, Bihar, Rajasthan, Assam, Madhya Pradesh and Orissa occupy bottom places in terms of ranking. It is only when we include livestock that Jammu and Kashmir and Himachal Pradesh join the top group. Livestock is important as an asset in states where the size of holdings is small. As against the all India average of 2.2 hectares, the average size of holdings is 1.43 in Jammu and Kashmir, 1.49 in HP, 1.55 in UP, 1.28 in Assam and 1.25 in Bihar. In all these states, small holdings keep livestock partly for supplementing incomes from cultivation and partly for increasing their liquidity. If the states are ranked on the basis of agricultural implements, only Punjab, Haryana, Tamil Nadu and Gujarat occupy the top four positions while Karnataka, Rajasthan, Madhya Pradesh and Orissa occupy relatively lower positions.

The pattern of asset holding and the per hectare value of asset holding indicates that Punjab, Haryana, Tamil Nadu and Gujarat belong to one category while Karnataka, Rajasthan, Madhya Pradesh and Orissa belong to another group. Excepting Gujarat, trends in other states indicate that the value of asset per acre is higher in states where the proportion of irrigated area is higher. Percentage of irrigated area to total cultivated area is 74.5 in Punjab, 46.6 in Haryana, 34.9 in Tamil Nadu, 10.1 in Karnataka, 6.8 in Orissa, 13.9 in Rajasthan and 7.9 in MP. Obviously, agriculture is more prosperous in irrigated areas as compared to non-agricultural areas.

At this stage, it will be interesting to compare the NSS Survey and RBI Survey results by ranking the states on the basis of the per-hectare value of assets (NSS) and per household value of assets (RBI). While making this comparison, we are aware that the asset components by the two surveys show HP, J and K, Punjab and Haryana to occupy the upper positions while AP, MP, Orissa and Karnataka occupy lower positions. Kerala, Tamil Nadu and Assam get much lower ranks under the RBI estimates as compared to NSS estimates. In the case of Kerala and Tamil Nadu, this difference may be explained by the fact that the rural households in these states are much worse off in terms of assets, such as financial assets, consumer durables and buildings.

When we tried to relate the per hectare value of assets with yield rates of some important cereals, we got a mixed picture. We have worked out rank correlation coefficients of the above two variables for cereals, wheat and rice classifying assets on the following basis for the major wheat, rice and cereals states:

Case I : Assets including livestock.
Case II: Assets excluding livestock.
Case III: Only agricultural machinery as assets.

The results indicate a significant relationship between per hectare yield and per hectare value of assets for cereals and wheat, in respect of Case I and III. However, when we exclude livestock, i e, Case II, this relationship is diluted, presumably because of the over-riding importance of livestock in crop production. Again, the lack of association between value of assets and yield for rice is understandable in view of the fact that this crop is grown under widely varying agro-climatic conditions (unlike wheat). As such, variations in yields across states may not be directly explained by variations in assets.

Conclusion

The above analysis indicates that livestock continues to be the predominant form of asset, particularly for small cultivators, for a variety of reasons. Livestock as an asset is more important for states where the size of holdings is small. Of all the states, Kerala does not attach much importance to livestock, owing to the plantation-oriented cropping pattern of Kerala. For the same reason, non-

farm business equipment is important to Kerala. This is also because of the importance of fishing as the major subsidiary occupation of the state. Agricultural machinery as an asset is important to Punjab, Haryana, Tamil Nadu, Maharashtra and Gujarat as operations connected with cultivation are more mechanised in these states.

Assets held are more evenly distributed in relation to land area cultivated only in the case of medium farmers while it is unevenly distributed in the case of small and large sized holdings. There is considerable concentration of assets in the larger holdings. If one looks at 'inter-state' variations in distribution of assets, it appears that Gujarat, MP, Rajasthan and Maharashtra which account for bulk of land area also account for bulk of other assets. In terms of per-hectare value of assets, Punjab, Haryana, Tamil Nadu, Kerala and Gujarat seem to be ahead of most of states. Asset value per hectare of land is higher in these states where the proportion of irrigated area is more. Variations in per hectare value of assets across states appear to be directly related to variations in yields per hectare. If crop yields in backward regions are to rise, institutional reforms aimed at a more even distribution of land and non-land assets appear to be as important as public investment in irrigation and fertiliser production.

Appendix A: Asset Components (NSS)

(1) *Livestock*
Cattle, buffaloes, sheep, goats, horses and ponies, mules, donkeys, camels, other draught animals, pigs, poultry.

(2) *Agricultural Machinery*
Ploughs, harrows, seed drill, sprayer, dusters, trailers, threshers, pumps, cane, crushers, oil crushers.

(3) *Transport Equipment*
Bicycle, motor cars, trucks/lorries, buses, motor cycles, scooters.

(4) *Non-Farm Business Equipment*
Handlooms, semi-automatic and power looms, ginning, pressing and baling equipment, reeds, bobins and other accessories used in spinning and weaving.
Oil mills (power driven), rice milling and pounding equipment, flour milling and grinding equipment, sewing machines, other tailoring equipment, saws, lathes, casting, melting and welding equipment, equipment in smithy shops, potters wheels, fishing nets, musical instruments, electric motors, oil-engines, other equipment.

(5) *Transport Equipment*
Boats, motor cars, carts, bicycles, motor cycles, scooters, trucks, trailers, passenger buses, others.

Appendix B: Asset Components (RBI)

All items owned by the household which had money value such as land, building, livestock, agricultural implements and machinery, non-farms and transport equipment, durable household assets, dues receivable on loans advanced in cash and kind, shares in co-operative societies, banks etc, National Plan Savings' Certificates and the like deposits in companies, banks, post offices and with individuals. (Crops standing in the fields, currency notes and coins in hand and stocks commodities, were, however, omitted from enumeration.)

Rural Retrogression and Institutional Finance

V A Avadhani

The object of this paper is to present some evidence of developments in rural retrogression over the last two decades and to examine the role of institutional finance in these developments. These retrograde developments are increasing rural poverty, unemployment, and inequalities of incomes and wealth. Data relating to these are discussed in Part I.

Institutional finance, if properly used for rural capital formation and growth, would have been a corrective to these trends. Part II highlights the inadequacy of institutional finance from the point of view of the estimated rural credit requirements in the country. The relative importance of various agencies supplying institutional finance is also assessed in terms of branch network, deposits mobilised, finance provided, etc.

Part III sets out the concentration of institutional finance, state-wise and asset-group-wise. This throws light on the inadequate provision of finance to weaker sections of the rural population and in the underdeveloped regions. This part also attempts to examine whether and to what extent institutional finance was responsible for the greater inequalities in income and wealth among the various strata of rural people.

I

Rural Retrogression

ACCORDING to the data of NSS (27th Round, 1972-73) the proportion of the total rural population chronically unemployed was only 0.5 per cent. The unemployment rate estimated from the labour time disposition of person-days, according to the current status, was 7.8 per cent for rural areas and 8.9 per cent for urban areas. The Planning Commission in the draft Five Year Plan, 1978-83, estimated the unemployment to be 21 million in March 1978. Of these 16.5 million were in the rural areas and the rest in the urban areas. Over the period 1971-78, rural unemployment (chronic status) was estimated by the Planning Commission to have increased from 1.7 million to 2.0 million. The data on chronic unemployment are not a clear indicator of the extent of idle manpower in the rural sector, as these data do not include the various degrees of under-employment and disguised unemployment. Supplementary data collected by the NSS, on underutilisation of manpower in the rural areas (1972-73), place underemployment at around 46 million out of a total rural population of 461 million in 1972-73. These data are set out in Table 1 which indicates that the problem in the rural areas is more acute than in the urban areas.

Data on rural incomes and wealth are scanty. Available estimates on rural assets, from RBI decennial surveys, reveal that over the decade 1961-71 there was an increase in the concentration of assets for all rural households — particularly in the states of Assam, Gujarat, Orissa, Punjab, West Bengal and Rajasthan.[1]

The data on consumer expenditure indicate inequalities in both rural and urban areas.[2] The proportion of households falling in the poor category[3] was higher, at 42 per cent, in rural areas than in urban areas, where it was 27 per cent (Table 2). It is well known that the propensity to consume is higher among the poorer classes and that they spend the bulk of their expenditure on food items, leaving very little for non-food items and capital formation. An indicator of inequalities and poverty is the proportion of expenditure on food items. The larger the differential in the proportion of expenditure on food as among the various expenditure brackets, the greater *prima facie* are the inqualities of income. Judged by this criterion, the rural sector is characterised by greater poverty and inequalities. Table 3 presents the data on the percentage of expenditure on food items by various expenditure classes in rural and urban areas. It will be seen, therefrom, that the percentage of expenditure on food was higher among all expenditure classes in rural areas than in urban areas — except in the comparatively top expenditure brackets of Rs 150 per month and above. As against the distribution of population, of 80 per cent in rural areas and 20 per cent in urban areas, the consumer expenditure as estimated from the NSS rounds was 60 per cent in rural areas and 40 per cent in urban areas. Even for the weaker section of the population (as given in the NSS 25th round) the per capita per month expenditure of rural households was significantly less than that of the urban per capita per month expenditure.

Estimates of those below the poverty line vary with the definition of poverty. According to the data of NSS 28th round, the extent of poverty is more alarming in the rural areas at nearly 42 per cent as compared with 27 per cent of the urban population in 1973-74 (Table 2) based on the norm of Rs 41 per month per capita. There are a number of estimates of the rural poor by Dandekar and Rath, Minhas, P D Ojha, Bardhan, etc.[4]

The criterion applied by the Planning Commission was the minimum consumption of 2,400 calories per person per day in rural areas and 2,100 calories per person per day in urban areas. As the data of NSS rounds on consumption expenditure were given in terms of rupees, the Planning Commission estimated the extent of poverty

TABLE 1 : UNEMPLOYMENT AND UNDER EMPLOYMENT

(in millions)

	Rural	Urban
	Actual Estimated Number	Actual Estimated Number
Chronic unemployed	1.83 (0.47)	2.03 (2.01)

Note : *This appears incredible as the lowest expenditure bracket spent only 53 per cent on food in the urban area.

Source : Worked out on the basis of the NSS data, 28th Round (1973-74)

on the basis of minimum consumption expenditure of Rs 20 per capita per month at 1960-61 prices.[5] At 1972-73 prices, the corresponding minimum expenditure per capita per month was put at Rs 41 on the basis of price adjustment. This requirement in 1977-78 was estimated by the Planning Commission at Rs 62 in rural areas and Rs 71 in urban areas. According to these criteria, the percentage of population below the poverty line in 1977-78 was put at 48 in rural areas and 41 in urban areas. On this basis, the percentagge of population below the poverty line appears to have increased from 42 per cent in 1973-74 to 48 per cent in 1977-78.

There are thus discernible trends of rural retrogression in India over the last few years. According to a study by Simon Kuznets,[6] the main causes of poverty in any country are: low productivity and excessive dependence of labour on agriculture. The low productivity of workers can be corrected through application of technological developments which finance helps through provision of improved tools, equipment, seeds, fertilisers, etc. Secondly, finance also helps diversification of agriculture into non-farm activities — such as industry, trade, commerce, etc — which reduces the excessive dependence of labour on agriculture. If finances were adequate to cater to the requirements of rural households in the above context and helped through proper flows, the growth of capital formation and application of technology, the retrograde developments would have been less active. It is in this context that the policy of financial assistance for the rural sector by institutional agencies becomes relevant. Discussion is concentrated in this paper on institutional finance — first, because of government's policy of institutionalising all rural credit, and secondly because of the non-availability of data on non-institutional finance other than from the decennial surveys of the RBI.

II

Institutional Credit Inadequacy

According to RBI decennial surveys on Rural Debt and Investment, total institutional credit (borrowings) constituted only 19 per cent of the total credit in 1961-62 but rose to 22 per cent by 1971-72. Of the institutional finance in 1971-72, about 77 per cent was granted by co-operatives followed by government (15 per cent) and the rest by commercial banks (8 per cent). In 1977-78, of the total institutional finance[7] co-operatives supplied 66 per cent followed by scheduled commercial banks (28 per cent), government (4 per cent), and the regional rural banks (2 per cent) (Table 4). The share of commercial banks in the total institutional finance, which was about 3 per cent in 1961-62, increased to 8 per cent in 1971-72 and further to 28 per cent by 1977-78, while the share of the co-operatives and the government correspondingly declined. As the regional rural banks have entered the field only in 1976 their share in total institutional finance was negligible.

Estimated Credit Requirements

The Working Group on Co-operation (Fifth Five Year Plan) had estimated the short-term credit needs of agriculture at around Rs 2,500 crores in 1973-74 on the basis of a credit requirement of Rs 250 per hectare of irrigated area and Rs 125 per hectare of unirrigated area.[8]

Table 5 presents set of estimates of credit requirements per annum based on the norms of Rs 250 and Rs 125 per hectare of irrigated and unirrigated land, respectively. These estimates for each of the states are weighted according to the actual borrowing per acre in the states on the basis of the AIDIS data 1971-72. The estimates relate only to short-term requirements. By 1976-77, the actual achievement was less than the estimated requirements in all states — except Assam, Orissa, Gujarat, Karnataka, and Maharashtra. The actual figures for Assam and Orissa were themselves low, at Rs 15 crores and Rs 43 crores, although this exceeded the estimated requirement due to low weightage given to them in 1971-72. The unweighted credit requirement for Assam and Orissa would have been Rs 45 crores and Rs 102 crores, respectively.

The objective of government's policy is to ensure that all requirements of agricultural credit are met by institutional agencies as early as possible. As nearly 94 per cent of the institutional finance was provided by co-operatives and commercial banks in 1977-78, this paper concentrates on these institutions.

Among them, the largest network is that of co-operatives, with about 1,24,000 primary agricultural credit societies covering about 43 per cent of rural population at end-June 1977. The commercial banks have a branch network in rural areas of 11,000 in Dec-

ember 1977 as compared to 1,443 in June 1969. Their advances outstanding in rural areas were about Rs 877 crores at end-December 1976, constituting about 11 per cent of total outstanding advances, as against Rs 54 crores in 1969.

The branches of co-operatives have declined over the period 1969-77 due to the policy of weeding out the weak and non-viable societies, but their outstanding advances had increased, from Rs 619 crores to Rs 1,598 crores over the same period. The commercial banks have shown greater progress in rural areas than have co-operatives during this short period (Table 6).

In the case of co-operatives, their advances are nearly 10 times more than their deposits — which only indicates that they have been lending funds belonging to other financial institutions particularly of the RBI, ARDC, etc. The drawals on the RBI in 1977-78 by co-operatives were Rs 1,429 crores. Commercial banks are lending only about 56 per cent of their deposits in the rural areas, which implies that funds are diverted by them from rural to urban areas. Although co-operative banks have the largest network, the efficiency is also low, overdues position high, and viability poor in the case of many societies. Rural branches of commercial banks take as much as four to five years to break-even but in view of their large resources the losses of the rural branches are made good by surpluses in other areas.

The need for strengthening the institutional financial structure in the rural areas can be seen from the following. First, the finance provided per hectare by all institutions falls significantly short of the required amount in most of the states. Secondly, population covered per rural branch of commercial banks is about 40,000, whereas the same for a branch other than a rural branch was about 13,000. Taking all the financial institutions in the village together, the rural population covered per branch had increased (instead of falling) from 2,477 in 1969 to 4,181 by 1977 due to the winding up of some primary co-operative societies. This indicates that available banking facilities had in fact decreased in the rural areas over the period 1969-77 (Table 7).

The amount of deposit per branch collected was hardly Rs 12,000, and advances for branch were Rs 56,000 in 1969. Over the period 1969-77, the deposit per branch had increased by nearly ten times and advances per branch had increased only by four times. The amount of deposits per branch was Rs 1,29,000 and advancies per branch was Rs 2,36,000 in 1977. These national averages were exceeded in only a few states such as Gujarat, Karnataka, Kerala, Punjab, Haryana and Tamil Nadu, which are agriculturally progressive. A similar picture emerges when we compare deposits per village and advances per village by all institutions in the rural areas. The performance in terms of deposit mobilisation was much better than that of advances during 1969-77.

Scheduled commercial banks have improved their credit-deposit ratio from 37 per cent in 1969 to 56 per cent in 1976. The commercial banks were expected to have pushed up the credit-deposit ratio to at least 60 per cent by end-December 1978. At the rate at which commercial banks are progressing in the direction of covering the rural areas through their branch network as well as their credit activities, they may be able to fill in the gaps in the institutional financial structure in the rural areas within a shorter time than co-operatives alone could do. The RRBs, started recently "have displayed a potential for making a significant contribution to filling up the credit gap".[9] The credit-deposit ratio of RRBs was about 125 per cent in June 1977. It is obvious that what is needed is a proper demarcation of activities of these institutions to ensure that each has its own role to play in the disbursal of credit and in the process of overall development in the rural areas, rather than confine the gigantic role of rural reconstruction to one set of institutions — *viz*, the co-operatives. The basic featurers for healthy development of any financial system are competition and efficiency and to the extent that these are promoted by the entry of new set of institutions and new financial assets, it should be a welcome development. So far as adequacy of institutional finance is concerned, it is obvious from the above discussion that the existing institutional arrangements are pitifully inadequate.

III

Concentration of Institutional Finance

Table 7 shows that the states which had done well, both in deposit mobilisation and in disbursal of credit, were agriculturally well-developed states such as Tamil Nadu, Gujarat, Karnataka, Uttar Pradesh, Punjab and Haryana. These are also the states which recorded higher deposits and higher advances per village than the national averages in this regard. In some states, both deposit mobilisation and credit disbursal are underdeveloped — as in Assam, Bihar, Orissa, West Bengal, Madhya Pradesh, and Rajasthan. Broadly, geographical credit gaps still remained to be filled, as both commercial and co-operative banks are concentrating only in areas with development potential.

Judged by the AIDIS data on the proportion of households reporting borrowing against various agencies, it is found that the proportion of households reporting borrowing from co-operatives was significantly larger than from commercial banks in 1971-72 (Table 8). The proportion of households reporting borrowing from co-operatives to total reporting households was the highest in Punjab (46 per cent) followed by Maharashtra (29 per cent) and Kerala (27 per cent), as against the all-India average of about 15 per cent. Haryana, Himachal Pradesh, Madhya Pradesh, Uttar Pradesh, and Tamil Nadu also reported a proportion higher than the all-India average proportion in this regard.

In the case of commercial banks, the proportion of households reporting borrowing as a percentage of total reporting households was generally small, at less than one per cent, but the same proportion was relatively high in Kerala, Karnataka, Tamil Nadu and Haryana. These states also happened to be agriculturally well-developed and they accounted for the bulk of the ad-

vances granted by commercial banks. This confirms our earlier conclusion that concentration of both the commercial banks and co-operative banks is in the same states — *viz* agriculturally well-to-do states and not in the poorer states.

The Lorenz curve of concentration would show a larger concentration of total borrowings of cultivators from all agencies in 1971-72 than in 1961-62. The Ginni co-efficient of concentration was 0.4014 in 1971-72 as against 0.3690 in 1961-62.

Due to difficulties of comparing asset groups in 1961-62 and 1971-72, the cultivator households have been classified into the following fractile groups based on the proportion of households covered. These asset groups are comparable as they fall into the same fractile groups of rural households both in 1961-62 and in 1971-72 on the basis of the theoretical distribution drawn for the purpose.[10]

Henceforth, discussion will be focused on these four groups which for our purposes may be taken to correspond to marginal cultivators, small cultivators, medium cultivators and large cultivators, respectively.

As between various groups of cultivators, the Group I cultivators constituted about 6 per cent of the total cultivators in 1971-72, of whom about 24 per cent reported borrowing and 11 per cent reported repayments.[11] In the case of large cultivators (Group IV) who accounted for about 40 per cent of the total households in 1971-72, 32 per cent of them reported borrowing and 13 per cent reported repayments (Table 9). The ratio of households reporting repayment to those reporting borrowing was higher at 46 per cent and 49 per cent in the case of marginal cultivators and small cultivators, as compared to 42 per cent for large cultivators. The proportion of the amount repaid to the total amount borrowed remained constant for all classes of households at around 87 per cent in 1971-72. In 1961-62, however, the proportion of households reporting repayment to those reporting borrowing increased with the asset size, except in the case of large farmers. A larger proportion of farmers repaid loans among marginal, small and medium farmers than among large farmers, both in 1961-62 and 1971-72. Similarly, the proportion of the amount repaid to the amount borrowed increased with the asset-size in 1961-62 while it remained almost the same for all classes of farmers in 1971-72 (Table 9). This would imply that repayment performance of the large cultivators was generally bad in both periods, while at the same time the proportion of households borrowing and their share in total borrowing were higher for large farmers than for other categories.

Table 10 presents data on the flow of institutional finance to various categories of cultivators during 1961-62 and 1971-72 While the share of large farmers in the total institutional finance of all categories of farmers has increased over the decade, from 77 per cent to 85 per cent, the same had generally declined in the case of poorer categories of cultivators. Similarly, the share of institutional finance in the total finance for each category has increased over the decade in the case of large farmers while it has declined in respect of other categories. It is obvious from the above that the hypothesis that large cultivators had benefited more by institutional credit than small cultivators holds good (Table 10).

In the case of large farmers, borrowing for production purposes in 1971-72 worked out higher at 46 per cent than for other categories and for consumption purpose it was higher at 48 per cent in 1971-72 than in 1961-62. The share of large farmers in the total finance provided by all agencies (including non-institutional) was the highest as compared with other categories of cultivators in respect of production purpose (80 per cent) and consumption purpose (61 per cent) (Table 11). Over the decade 1961-71, the proportion of borrowing for production purposes declined for marginal, small and medium farmers, while it remained almost the same for large farmers.

A major criticism of institutional financing is that large farmers are able to secure a larger finance from institutions, some of which might have been diverted for unauthorised purposes or money lending to small farmers, with a view to securing economic and social hegemony.[12] The fact that large farmers could have diverted a share of their institutional finance cannot be substantiated by data. However, data show that their share of institutional finance had increased much more than the share of other categories of farmers over the decade. Secondly, their borrowings for consumption purposes had increased, though their need for consumption purposes would have been smaller in view of the higher incomes and higher productive assets. Thirdly, their repayment performance was poorer than that of marginal farmers, implying thereby that part of their funds could have been used for unauthorised purposes. The large amounts of overdues of the co-operatives is a standing

Group of Cultivators	Value of Assets 1961-62	Value of Assets 1971-72

Institutional Agencies-Total	*18 7*	*22.0*

testimony to the wilful default and non-payment by some of the borrowers from co-operatives who are mostly large farmers in 1971-72[14]

The available data from the All India Debt and Investment Survey results show that, over the period 1961-71, there was a decline in the share of agricultural moneylenders in the total credit to cultivators over the decade This gap was promptly taken advantage of by the traders relatives, and friends, some of whom might be categorised as absentee landlords or large farmers (Table 12)

Data on the proportion of households reporting as well as the average amount of borrowing per cultivator household asset group-wise and agency-wise are presented in Table 13 It will be seen from the Table that in the case of both co-operative and commercial banks, richer farmers in the higher asset groups had benefited more than the smaller asset groups both in terms of proportion of households reporting and the average amount borrowed Repayments as a proportion of borrowings were about the same varying from 80 to 90 per cent for various asset groups However, the proportion of households reporting repayments to those reporting borrowing is lower in the higher asset groups than in the lower asset groups, reflecting the fact that richer farmers had defaulted more than the smaller cultivators in their repayment performance — further supporting the earlier hypothesis that there are weaknesses in the present system of institutional finance

Institutional finance had not fulfilled the objectives of planning to any significant extent by helping the poorer classes of villagers and promoting their productive activity On the other hand, it might have led to increased inequalities in income and wealth in the rural areas It has benefited mostly the larger cultivators Institutional finance was also expected to increase employment and incomes of the people through Rural Development Projects, self-employment schemes etc But there was no evidence of a falling unemployment or poverty on the contrary, there was evidence of increasing poverty and unemployment

SUMMARY AND CONCLUSIONS

This paper has attempted to bring out some evidence in support of increasing rural poverty and unemployment and increasing inequalities of income and wealth Admittedly, these retrograde developments cannot be attributed mainly to institutional finance If anything, the institutional finance has only a marginal impact on rural incomes and employment through increased output and productivity. But this paper has highlighted certain weaknesses in the operation of institutional agencies supplying rural credit which might have aggravated these trends instead of correcting them First, institutional finance, provided even for short-term purposes, appears to be inadequate Secondly, even now the existing institutional agencies could not meet all the credit gaps in spacio-sectoral terms Both co-operative and commercial banks seem to have concentrated on the agriculturally well-to-do states with potential for development rather than on diffusing to a wider geographical area Judged by the branch network the banking facilities available to the rural sector appear to have declined over the period 1969-77

TABLE 11 PURPOSE-WISE CLASSIFICATION OF BORROWINGS—GROUPS OF CULTIVATORS

(in percentages

Fractile Groups of Cultivators	Production Purposes		Consumption Purposes		Other Purposes	
	1961 62	1971-72	1961-62	1971-72	1961-62	1971-72
Group I 0-22 per cent	0 6 (15 6)	0 6 (17 5)	2 2 (71 6)	1 9 (69 8)	1 2 (9 8)	1 6 (12 7)
Group II 22-60 per cent	11 0 (30 8)	7 4 (22 9)	19 3 (59 4)	17 6 (65 5)	13 4 (9 8)	13 8 (11 6)
Group III 60-76 per cent	15 3 (36 7)	12 4 (31 1)	20 2 (53 4)	19 1 (57 5)	15 8 (9 9)	16 8 (11.4)
Group IV Above 76 per cent	73 1 (47 0)	79 6 (46 4)	58 3 (41 3)	61 4 (43 0)	69 6 (11 7)	67.8 (10.6)
Total	100 0 (42 3)	100 0 (40 4)	100 0 (46 6)	100 0 (48.6)	100 0 (11 1)	100.0 (11.0)

Note Figures inside parenthesis denote percentage shares of borrowings for various purposes Data relate to all agencies as separate data for institutional agencies are not available under the AIDIS, 1971-72
Production purposes relate to farm and non-farm purposes, both current and capital.

Total	4.3	34.0	0.2	3.9	29.3	203.9	13.1 (44.7)	178.0 (87.3)

Note : A = Proportion of Households Reporting (Per Cent). B = Average value per Household (Rs). Figures in brackets indicate the proportion of households reporting repayment to the total reporting borrowing and average amount of repayment to total amount borrowings.

Source : AIDIS, 1971-72

According to the RBI's decennial surveys on Rural Debt and Investment, there was an increased flow of institutional finance over the period 1961-71. But the bulk of it had benefited the larger farmers and was not used for productive purposes. It was also the large farmers who had defaulted more than the smaller farmers. There was evidence of increasing inequalities of income and wealth in the rural areas. It would appear, however, that there was a larger flow of funds to the weaker sections of rural society after 1971-72.

Increasing banking habit and growth of monetisation are prerequisites for rural reconstruction. Towards this end, there is need for strengthening the institutional structure — particularly for deposit mobilisation and increased flow of funds for the weaker sections of rural population and the under-developed regions in rural sector.

Notes

[This paper was presented at a Seminar of the Indian Association for Research in National Income and Wealth, held at Trivandrum between January 12 and 15. The author acknowledges gratefully the benefit of comments from V V Divatia and N A Mujumdar.

1 V V Divatia 'Inequalities in Asset Distribution of Rural Households' Reserve Bank Staff Occasional Papers, June 1976. G A Kelkar and S Subramanian 'Pattern of Assets of Rural Households 1961-71', RBI Staff Occasional Papers June 1977.

2 The inequalities discussed here relate to inequalities in consumption expenditure which is taken as a proxy for incomes in the absence of data on the latter.

3 Poverty line is defined as those falling below a minimum nutritional requirement represented by a consumption level of Rs 20 per month in 1960-61 and Rs 41 per month in 1972-73.

4 D N Dwivedi, "Economic Concentration and Poverty in India", Dutta Book Centre, Delhi 1974, V M Dandekar and N Rath "Poverty in India" 1971; T N Srinivasan and P K Bardhan (*Ed*) "Poverty and Income Distribution in India", 1974. According to Bardhan and Ojha, the percentage of rural poor was higher than that of urban poor and was growing (P K Bardhan, *IER*, April 1971 Volume VI, No 1 and P D Ojha, *RBI Bulletin*, January 1970).

5 The Study Group set up by the government in 1962 recommended a level of expenditure of Rs 20 as the national minimum. Dandekar and Rath have taken Rs 15 as the rural minimum and Rs 22.5 as the urban minimum, monthly expenditure per capita, for 1960-61.

Maoist Theory and Practice

Sumanta Banerjee

The Political Philosophy of Mao Tse-tung by Manoranjan Mohanty; The Macmillan Company of India; pp 206, Rs 55.

MANORANJAN MOHANTY's book is an extremely erudite treatise, meticulously worked out from a Marxist viewpoint. He deals with Mao's political philosophy as it developed in the course of, and was implemented during, the revolutionary movement inside China before liberation and the post-liberation construction phase. On the philosophical plane, Mao's views on materialist dialectics are dealt with in a separate chapter at the end of the book.

Since the interaction between theory and practice is the hallmark of Marxism, Mohanty traces the development of Maoism to the concrete situation in China. His narrative flits to and fro between discussion of the theories and description of the actuality, in the course of which he raises modestly certain vital questions regarding the consistency of some of the Maoist theories and their implementation today.

The ideology and strategy of the new democratic revolution formulated by Mao in the wake of Comintern-led Communist disaster in China, the handling of contradictions and the question of united front, the stress on the agrarian poor, the mass line, the guerrilla-based people's war — all these important components of Maoism during the revolutionary phase are adequately dealt with in the first chapter. Mohanty continues to suggest in the next chapter that Mao's theory of new democracy — which was the basis of post-liberation construction in China — was the culmination of a series of conceptual as well as practical developments during the Chinese revolution. Thus, the need for united front with the KMT to resist the Japanese led the CPC to reformulate its revolutionary programme of social transformation by moving a step backward from a socialist programme of confiscation of land to a democratic anti-feudal programme of land reforms, rent reductions and elementary co-operativisation. "But its continued practice even after the Sino-Japanese war suggested that it was more than an opportunistic rationalisation to get the support of the Kuomingtang (KMT) The policies during the 1949-50 period were basically of people's democratic nature rather than of socialistic nature." Mohanty shows how at every step, the theories were developed in the light of the concrete necessities. But he maintains: "the theory of new democratic revolution applied Marxist-Leninist theory of revolution to the conditions of the colonial East without sacrificing any of its core postulates."

An important element in Maoism is the theory of class struggle in a socialist society. Mao's views on contradictions are well known. The problem of solving contradictions in a socialist society, whether to regard such contradictions as antagonistic or non-antagonistic were questions with which the Chinese Communists had to come to grips right from the beginning of the establishment of the People's Republic of China. In this connection Mohanty takes up Mao's famous speech 'On the Correct Handling of Contradictions among the People' of February 27, 1957, and hints at a possible ambivalence in Mao's approach at that time. While in one part of his speech Mao speaks of the continuing class struggle between the proletariat and the bourgeoisie in a socialist society, in another part he says: "Contradictions in a socialist society are fundamentally different from those in the old societies... In capitalist society contradictions find expression in acute antagonisms and conflicts . On the contrary, the case is different with contradictions in socialist society, where they are not antagonistic and can be resolved one after another ..." Mohanty notes: "... there seems to be some inconsistency in this." He leaves it at that. But there is more to it.

Actually, the problem of dealing with inner-party differences has been plaguing post-revolutionary Communist societies all these years. One hoped that Maoism could provide a civilised answer. But the initial Maoist promise to regard differences within the Chinese Communist society as non-antagonistic and deal with them in a tolerant way has been replaced by a tendency to reduce such differences to antagonistic contradictions and handle them in a repressive way. In fact this had started even during Mao's lifetime, as evident from the treatment meted out to Liu Shao chi who was denounced as a capitalist-roader. Honest differences may arise among Communists as to the programme of development. But in the course of a debate over this, when one group tries to identify the other group with the capitalist class or counter-revolutionaries, it clearly becomes a typical case of bourgeois politics of character-assassination. It is easy to sway the masses by branding a rival politician with the most odious appellation. In a communist society, the word "capitalist" is one such term which immediately antagonises the masses. By disposing of political opponents in such a summary way, impatient ruling groups can implement their particular programmes of development, but the entire method is bound to have a backlash, as happened in the Soviet Union. In China, it has led to ridiculous results. Victims of the Cultural Revolution campaign are now gradually being rehabilitated. One such case is that of Wu Han, the former deputy mayor of Peking and author of 'Hai Rui Dismissed from Office'— the opera which was denounced by Mao Tse-tung himself in 1965. The attack on Wu Han in fact initiated the Cultural Revolution. We were told at that time that the Chinese people after intense ideological debates over the opera had come to know the real nature of Wu Han who was described as a 'poisonous weed'. To day, we are told that Wu Han's "conscientious attitude and historical-materialist approach enabled him to successfully project on the stage the image of an upright court official of the 16th century", and that he was "framed and brutally persecuted" by the 'gang of four'. "Today their wrongs have been duly redressed." (*Beijing Review*, No 10, March 9, 1979). While the gang of four is being made the scapegoat for the alleged "frame up", the CPC is silent about Mao who at that time led the attack on the opera. Clearly, this is an opportunist manoeuvre.

Although Mohanty does not go to this extent in criticising the CPC, he is compelled at one stage to comment: " .. since every campaign reflects the ideological orientation of the ruling group and every ruling group gives its own interpretation of Marxism, this system gives ample opportunities for wrong policies to rally popular support." One should conclude

from this that the system needs a thorough overhauling to prevent such mass rallying around "wrong policies", particularly in view of what Mohanty says later about Lin Piao's rise: "Lin Piao took advantage of the mass upsurge to increase the dominance of the PLA." But here again Mohanty ignores Mao's role behind Lin's rise. Although Mao later opposed Lin, during the Cultural Revolution he lent his support to the ambitions of the politically ambitious Lin probably to sway the army in his favour in his fight against the central party bureaucracy. In 1971-72 one of the charges against Lin was that he had popularised the 'genius cult'. But was Mao unaware of it throughout the days of the Cultural Revolution when Radio Peking and the Chinese press were making absurd claims about people getting cured or achieving increasing production by reading his Red Book of quotations?

Mohanty traces in a separate chapter the development of the Maoist world view, its emphasis on anti-imperialist revolution in the Third World, the shift of stress in the set of fundamental contradictions in the contemporary world, the views on war and peace and the changing attitude towards the Soviet Union, finally culminating in the *theory of the three worlds. Mohanty* feels that the three world theory is an extension of China's domestic strategy during the revolution to the world situation today. Referring to the CPC's trying to win over the intermediate classes like patriotic landlords, rich peasants and the national bourgeoisie during the revolution, he comments: The same approach applies now to the countries of the second world." But what is being *forgotten* in such an argument is that while striving to win over the intermediate classes in their country, the Chinese Communist party placed more emphasis on building up *its own independent* armed forces and base areas. To the extent that they could increase their armed strength and expand their bases, the intermediate classes switched over their loyalty to the *Communists.* The decisive factor in changing the balance of forces in favour of the Communists was the growing armed strength of the Communists. But in the international situation today, the balance *of forces* is decidedly not in favour of China. Besides, China is hardly making any effort to consolidate the socialist camp, which it thinks no longer exists, if we are to go by the *Renmin Ribao* article on the three world theory of November 1, 1977. On the basis of what strength is China going to win over the international intermediate forces — the Second and Third Worlds? Neither militarily, nor economically, can it claim to be a part of a consolidated *socialist* system that could emerge as a force to reckon with *vis-a-vis* the superpowers, and sway the vacillating intermediate forces in its favour.

Mohanty however notes the "aberrations" that are increasingly developing in China's foreign policy By "aberrations" he means China's tendency to overemphasise the Soviet threat and slacken the fight against the USA; China's dilemma in deciding whether the national liberation movement in South East Asia or friendly relations *with the ASEAN governments* would help fight superpower domination in the zone, China's encouragement of continued American presence in Western Europe. According to him, "... if these aberrations become more frequent, then this may suggest not only a deliberate shift in China's strategic line but also its departure from the world-view — a departure which theoretically should be justified only when world anti-imperialist revolution would have been successfully completed."

However cautiously raised, the questions posed by Mohanty about Maoist handling of contradictions and the Chinese world view, are extremely relevant for both political activists and observers. They need to be followed up. One hopes that Mohanty's book will *be an important contribution to the* work of investigation that has begun with regard to Maoist theory and practice.

The Meaning of Kayyur

P Radhakrishnan

The Kayyur Riot: A Terrorist Episode in the Nationalist Movement in Kerala by K K N Kurup; Sandhya Publications, Calicut, 1978; pp xvi + 122; Rs 40.

UNTIL 1940, Kayyur was *just* a speck in the political map of both Kerala and India. But it shot into prominence in 1941, when, after a series of incidents now known as the 'Kayyur riot', 60 persons were arrested and tried, and four of them hanged in 1943 for an alleged murder of a policeman. Their real crime was that they, along with many others, were bent upon pulling down an already tumble-down British administration, along with its pernicious product, landlordism.

The Kayyur Riot is an important event in the history of the nationalist movement in Kerala. There is an excellent novel on the Kayyur martyrs in Kannada, written by one of its leading writers (*Chirasmarane* by 'Niranjana'). In Malayalam, there is an exhaustive account of this event in which, as communist leader and an active participant of the Kayyur episode, its author has succinctly recounted the encounters and experience of the 'Kayyur Comrades', with imperialism and landlordism (*Kayyur Samaracharitram* by V V Kunhambu). The book under review is the latest to document the Kayyur episode and its chief merit is that it analyses this event in its historical and social context, ie, in the context of the emergence of the peasant movement and the Communist party in Malabar.

With a brief review of the agrarian system in British Malabar as the backdrop, in the first three chapters the author examines the rapid process of an ignorant, illiterate and unorganised peasantry getting politicised, organised and drawn into the mainstream of the nationalist movement. In the remaining chapters, he examines the Kayyur episode as a political event, and comes to the unambiguous conclusion that it was part of a wider political movement for independence.

The British administration in India was a repository of innumerable evils. Of these, its land management was the worst. In its anxiety to collect maximum revenue from land, Britain introduced, as its revenue-agents, a class of landed gentry with superior rights in land. The result of this has been the perpetration of landlordism, which, as a social evil survives even now. In Malabar too, which the British took over in 1792 (the other two regions of Kerala, Cochin and Travancore, were already under their suzerainty), they arbitrarily conferred absolute ownership rights (*janmam*) on the upper-caste landholders. How long a tenant held his land, or how soon he was driven out of it depended on how best he appeased the vagaries of his *janmi*. If for any reasons the tenant failed to pay the usual *varam* or *pattom* (ground rent paid in kind after every harvest) and other customary dues, he incurred the wrath of his *janmi* who could order his men to flog him, rob or destroy his orchard, steal his livestock, set fire to his hay-rick or even molest his women (which in most cases, he would have preferred

to x y himself). If nothing came out of all these heinous acts, then the landlord entered the dues in his loan register, the details of which the ignorant and illiterate peasant could never know. The *janmi* then compelled his family members to work in his fields on the pretext of recovering the dues and thus came into existence that loathsome institution 'bonded labour'.

During the period 1850-1921 alone, agrarian unrest in Malabar caused as many as 50 violent outbreaks and culminated in the Malabar Rebellion of 1921 in which hundreds of people lost their lives and a lot of property and livestock perished. During 1929-33, as a result of the depression, rural indebtedness, rack-renting, exploitation and eviction of the peasants vastly increased. An outburst of emotion and display of disgust with the ways of the government followed in different places, paving the way for the emergence of the Karshaka Sangham (Kisan Sabha) which sought to educate the masses and mobilise them for an organised peasant movement. The first regular unit of the Karshaka Sangham in Malabar was established in 1934. Gradually, a number of units of the Karshaka Sangham emerged in different places. Due to evermounting agrarian unrest, peasant movement in the rest of India was also catching up, and units of the Kisan Sabha sprung up in several parts of the country. With a view to unifying and integrating these scattered peasant organisations and bringing them under one flag, a larger organisation, the All India Kisan Sabha, was established in 1936. According to the author, this organisation was "an anti-imperialist front of all leftist political groups, from progressive Congressmen to Communists. Among its founders, national leaders and literary figures like Swami Sahajananda, Karyananda Sharma, Muzaffar Ahmed, Acharya Narendradev, Rahul Sankrityayanand Indulal Yagnik were included" (p 10). Within Malabar, the different units of the Karshaka Sangham were brought under the All Malabar Karshaka Sangham, which was organised in 1937.

To start with, the Malabar peasantry did not come out with the collective cry of 'land to the landless', 'land to the tiller', or 'death to landlordism'. Nor did they plan to organise a land-grab movement as it is done now. However, the landlords with the support of police tried to suppress even its genuine grievances and modest demands to alleviate them, such as abolition of illegal exactions, relief from rack-renting, etc. This resulted in the rapid escalation of landlord-peasant confrontation and conflict, and prompted the peasantry to itensify its struggle.

In the meanwhile the Congress party, backed by the peasant organisations in the region, won the provincial elections in Madras in 1937 and formed a provincial government. The Congress which until then had pretended to champion the cause of the peasantry deceived it when it assumed power. This change in the attitude of the Congress leadership dismayed the leftists within the party and the peasantry, and resulted in an inner-party crisis. This crisis reached its climax in January 1940, when, unable to bear any more with the principle of non-violence and passive resistance of the Congress leadership with regard to the war into which India was dragged, prominent leaders of the left-wing within it went underground and formed the Communist party. Their efforts to organise the peasants and workers with a view to linking up the peasant movement with the nationalist movement led to the party becoming mass-based and carried to its side the peasants and workers of Malabar. The peasant movement in Malabar was no more a mere peasant movement; it was a fight both against imperialism and landlordism, and was also a nationalist movement.

The Communist party in Malabar gave a state-wide call to observe September 15, 1940 as 'Anti-Repression Day'. Though the government banned meetings and public processions on this day, flouting the ban order, the party organised a number of meetings and processions which the police tried to disturb and disrupt. This resulted in police-public confrontations and clashes, and triggered off a series of violent events in the days that followed. On the Anti-Repression Day itself in an encounter with the police when it tried to disrupt a public meeting, two persons were killed. They are now remembered as the first Communist martyrs of Kerala. The Anti-Repression Day was followed by a Protest Day deploring the cruel behaviour of the police and on that day when the police again tried to disrupt a meeting of the peasants, they swung into action. In a fight between the peasants and the police, two policemen were killed in Morazha, and one at Mattanur. On the death of the policemen, the police force in Malabar turned trigger-happy and unleashed assaults and atrocities on whoever they thought was against the British.

Though these atrocious happenings spread a wave of terror throughout the state, Communists in Malabar decided to retaliate. The days that followed were therefore replete with violent confrontations between the police and the peasants. It is against this tense social backdrop that the Kayyur Riot has to be understood.

But what is this 'Kayyur Riot' which, according to the author, made Kayyur "a symbol of heroism and martyrdom for Communists all over Kerala"?

A group of about 200 persons including about a hundred Communist party volunteers were returning in a procession after participating in a public meeting protesting against police atrocities. As they were marching along shouting party slogans, they saw a police constable running towards them from the opposite direction. Some of the party volunteers leading the procession recognised this policeman as the person who had beaten them without any provocation while they were asleep in a tea-shop just two days before. The policeman was alone and his very appearance made them tremble with anger and vengeance. They therefore forced him to hold high the party flag and walk in front in the procession shouting party slogans. Being alone and helpless, he obeyed for sometime the commands of the party volunteers, but soon the very idea of walking in uniform holding a red-flag and shouting anti-imperialist slogans, provoked him to 'dutiful' action. Suddenly he broke the flagstaff, beat one of the volunteers in front of him and ran, thereby stirring a hornet's nest. A group of party volunteers coming from the opposite direction saw the strange sight of a policeman fast on his heels being chased by party volunteers from behind. They therefore blocked his way, and after a brief skirmish, the helpless policeman jumped headlong into the adjoining river, hoping to swim away to safety. But the hitherto disciplined members of the procession lost control and turned into a mob. Some of them started pelting stones at the policeman who soon drowned.

After this incident, police went on a rampage for a number of days. After a long and terrifying man-hunt, 60 persons were arrested and tried, of whom 38 were acquitted, four hanged, and the remaining convicted for different periods. This in short is the story of the Kayyur Riot.

Sundaram Finance Limited

180 Mount Road, Madras 600 006

Speech delivered by Sri T S Santhanam, Chairman, at the Twenty-fifth Annual General Meeting of the Company held on 20th June 1979, at Madras.

DEAR FRIENDS :

At the outset, I regret to inform you of the demise of Shri T S Srinivasan, our former Director on the 30th April, 1979. Shri Srinivasan was a Director of your Company from 1956 to 1973. During that period, he made valuable contribution to the growth and development of the Company. We share the grief with the members of his family.

I am happy to welcome you to the Silver Jubilee Annual General Meeting of your Company. This is also the best year so far in the history of the Company, the profit after taxes being an all-time record.

The Directors' Report, the audited Balance Sheet as on 31st December, 1978 and the Profit and Loss Account for the year ended 31st December, 1978 have been sent to you and with your permission, I shall take them as read.

WORKING RESULTS

I am happy to inform you that our business showed further improvement during the year 1978. The amount financed against hire purchase contracts during the year reached a record figure of Rs. 16.25 crores in 1978 as against Rs. 15.72 crores in the previous year. The supply position of commercial vehicles improved during the latter part of the year 1978. As a result of this, there was a greater demand for funds from the road transport operators.

DIVIDEND

The Company has been paying a dividend of 16% consistently for the past 9 years. Your Directors considered it appropriate to recommend a higher dividend over that declared in earlier years to commemorate the Silver Jubilee Year. A final dividend of 10% has therefore been recommended for your consideration and approval, making a total of 18% for the year. Consistent with past practice, the Bonus Shares issued in December 1978 for Rs. 50.00 lakhs also qualify for full dividend for the year 1978 and the dividend will be paid on the Capital of Rs. 200,00 lakhs inclusive of Bonus Shares.

DEPOSITS

The Company resumed acceptance of fresh deposits from the beginning of 1979. It is gratifying that the response from depositors has been extremely satisfactory. The additional deposits will be useful to meet the large demand for funds, which the Directors anticipate in the current year.

GENERAL

During the year 1978, the hire purchase charges were rationalised and the service charge was reduced from 3% to 1% in stages. Early in 1979 the latter was finally abolished. This will lead to lower profits in the current year than in 1978. You will be happy to hear that our hire purchase charges are among the lowest in India. This gesture has been greatly appreciated by our clients and the business inflow in the first five months amounted to Rs. 9.60 crores as against Rs 4.60 crores in the corresponding period in the previous year.

Vehicle manufacturers are expanding production of commercial vehicles in accordance with the Central Government's policy and the production has substantially increased in the first five months of the current year. We hope this trend will continue.

The operational cost of the road transport industry has been steadily rising and the increased excise levies have resulted in the high cost of commercial vehicles. It is to be hoped that the Governments at the Centre and the States will devise measures to ease the burden of duties and taxes to give a fillip to this vital sector of the economy. It is also hoped that the Planning Commission's recommendations for more roads, better roads and better surfacing of roads, which will in turn result in reducing the cost of road transport, will also find increasing acceptance.

ACKNOWLEDGEMENT

I take this opportunity to thank, on behalf of the Board of Directors and on my own behalf, our customers, depositors, bankers and shareholders for the co-operation extended to and the trust reposed in the Company, but for which we would not have achieved the growth registered during the past 25 years. I look forward to their continued support. I also wish to place on record my appreciation of the good work done by the Company's staff, both in the field and in the office.

Finally, I thank all the members present for making it convenient to attend the Meeting.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

The Tata Engineering and Locomotive Company Limited

Statement of the Chairman, Mr. S. Moolgaokar, for the year 1978-79

The year 1978-79 was a good year for your Compay. The Company's investments in Pune bore fruit and we were able to produce as many as 7,003 vehicles there. At Jamshedpur we produced 26,043 vehicles Thus the total production for the year amounted to 33,046 vehicles, which is the highest attained so far. Sales increased by 33.3 per cent and amounted to Rs 375 crores as against Rs 281 crores during the previous year.

Technological Maturity

2. These quantitative changes in our operations have been accompanied by an important qualitative change. We have become self-sufficient in technology and we do not expect any difficulty in steadily improving our existing products, widening our range and expanding our capacity to meet the growing needs of our country. Two new vehicles have been wholly designed by the Company's Engineering Research Centre. These are the 15-tonne, 160 HP heavy vehicle and the 4-wheel drive vehicle. The heavy vehicle will not only permit a substantially greater payload but will also result in considerable savings in fuel consumption per tonmile. This will enable the harassed and heavily taxed operator to achieve worthwhile operational economies. The 4 wheel drive vehicle has been designed for defence and civilian use in deserts, sandy tracts and rough, hilly country. Both these products will have an assured market. Prototypes of additional new products designed and produced indigenously will be displayed at the International Trade Fair to be held in Delhi this November. All these products should provide a good indication of the progress the Company has achieved in developing our indigenous technology. As a consequence, a wide range of vehicles will be produced as we keep on increasing our installed capacity. Steps are already being taken to implement expansion of our production from the existing level to 56,000 vehicles per annum. Most of the critical machine tools required will be manufactured by our Machine Tool Division which has been producing high-precision and sophisticated machinery like transferlines at costs which are substantially lower than the prices of equivalent imported machinery These in-built strengths will enable us to implement our forthcoming expansion more quickly and economically than other automobile manufacturers.

Component Industry

3. The lack, in some sectors, of a mature, balanced and well-developed Component Industry is now becoming a deterrent to the overall growth of the Automobile Industry in general and to the fuller utilisation of your Company's existing capacity in particular. Vehicle manufacturers are dependent upon the services of a number of suppliers of parts and components and much depends on the efficiency of their collective efforts. There are only a few suppliers who are at the moment capable of supplying updated products produced to consistent quality standards. For various reasons suppliers suffer from constant interruptions in their production. This in turn affects the rhythm of production of the main vehicle manufacturers and increases their costs.

4. Your Company continues to assist in every possible way the speedy development of a number of ancillary units. There are, however, certain sectors of the Component Industry where substantial additional capacity is urgently needed. These are thin-walled iron castings, heavy and complicated forgings made to tight tolerances, press tools, dies and precision tooling. Since such units are very capital and skill-intensive with a long gestation period, adequate capacity has not been established so far. Far more capacity in these areas is sorely needed to assist the growth of the Automobile Industry.

Power

5 The rate of growth of vehicle production is also dependent on adequate supply of power. In my Statement last year I had stressed that the power shortage had grown into the single largest deterrent to investment and growth. Unfortunately, there has been no improvement whatsoever. In fact, the shortage has become far more widespread and has now reached crisis levels in regions where it will hurt most — W Bengal, Bihar, Maharashtra etc

6 The solution to the nation's power problems cannot lie in the mere sanctioning and leisurely installation of numerous generating-stations all over the country. Thermal power stations which have necessarily to operate continuously for long periods require meticulous attention throughout the day. The operating teams must have the authority, freedom and incentive to run their sections efficiently so that a reasonable capacity utilisation can be achieved. Political interference in the management of the Electricity Boards has frequently resulted in the selection of incompetent people to man these vital installations.

7. Adequate supply of consistent quality coal has been a problem that has existed for many years. Yet nothing has been done to install washeries at the pit-heads of non-coking coal mines. If this were done, the operating efficiencies of the thermal stations could be improved substantially as they would be fed with coal of a consistent quality.

Labour Unrest

8. The alarming increase in industrial indiscipline and the deteriorating law and order situation also cry out for immediate attention. No amount of effort to enhance industrial production by installing additional capacity and improving the infrastructure can yield significant benefit unless Labour-Management relations are restored to an even keel. The nation-wide spate of strikes and lock-outs and the associated violence are of benefit to no one. The individual earnings of employees are lost, the productivity — and by productivity I mean the indispensable conditions of progress — the financial health and incentives for growth of companies are undermined and the Nation is deprived of progress and much needed revenues. This game no one wins, but it has been played for too long.

9. If industrial disharmony is allowed to continue, the long-term effects on productivity, discipline and the national character itself will be too damaging for repair. For over two years now we have been hearing about the Industrial Relations Bill and of a National Labour Policy but a decision acceptable to all concerned, let alone its implementation, has eluded us.

Inflation

10. Unfortunately, after three years of price stability, inflation is once again endangering progress. In the last four months, there have been substantial and rapidly escalating cost increases in the automobile industry. Whilst the only effective remedy in the long run is to accelerate the rate of investment and productive employment, I would

urge Government to concentrate its attention in the immediate future on providing the basic conditions required to increase production which are mainly stable industrial relations and adequate power supplies throughout the country.

Indirect Taxation and The Road Transport Industry

11. The oppressive burden of the wide range of indirect taxes is such that the operations of Telco vehicles alone generate almost 10 per cent of all the tax revenues collected from all sources by the Centre and the State Governments. These taxes increase the cost of road transportation by as much as 50 per cent. The burden permeates through all levels of society and affects the price of every product. In its report on Indirect Taxation, the Jha Committee noted that "The high cost of road transport has an adverse impact on the cost/price structure of the basic needs of the community. It also has a particularly unfavourable effect on those parts of the country which are really backward and in which no railway facilities are available or can be made available in the foreseeable future."

The report adds "The indirect taxation of road transport has a perceptible impact even on the lowest expenditure groups as it raises the cost of every necessity."

12. Pleas from all quarters, including committees appointed by Government itself, that the burden of indirect taxation on the manufacture and operation of commercial vehicles be reduced, have been made for several years now. But they have been of no avail. Some anomalies are incomprehensible: commercial vehicles meant for mass transport seem to be taxed more than cars and scooters meant for personal transport. For example, if the same concession given to the manufacturers of cars and scooters is given to the manufacturers of commercial vehicles, viz., exemption from excise duty on the purchase of tyres and batteries, the prices of our vehicles would come down by as much as Rs. 5,000.

Problems of The Transport Operators

13. Transport operators represent a growing class of new entrepreneurs. Since an increasing share of the future growth of traffic will inevitably move by road, they will be called upon to perform an increasingly useful function in our society. And yet they face problems of inadequate and unsafe roads and innumerable man-made impediments. The hardworking owner- operators *must be the most* harassed of individuals. On the move almost all the time, they work under conditions which are extremely hazardous and arduous. Owing to the loss of valuable time at a multitude of check-posts and the oppressive burden of taxes, it becomes imperative for the operator to overload the truck beyond permissible limits. For, otherwise, he can neither meet his repayment and tax liabilities nor look after the basic welfare of his family. The widespread practice of overloading and the need to minimise undue delays explain the element of gratification which is prevalent in the road transport sector.

14. Government's response to repeated pleas for increased ploughback of the tax revenues generated by the road transport industry into the maintenance, improvement and construction of roads continues to be grossly inadequate. There is considerable scope for stepping up the outlay, and Government should seriously consider re-investing in road transport a larger proportion of the tax revenues generated by this sector. Road building in the rural areas creates employment for the poorest of the poor. No other investment generates as much employment as the building of roads. And yet only a third of the tax revenues generated by road transport is spent each year on highways, roads and bridges.

15. As road traffic increases, road casualties are also increasing. Therefore, it is worth bringing to the notice of Government that existing regulations in matters affecting road safety are not effectively enforced. Standards for regular vehicle inspection are not adhered to. Even driving licences are granted to those who do not possess the requisite skills. Illegal gratification again has a hand in all these matters.

16. Commercial vehicles have also to be updated and built to meet increasing safety standards. Apart from what has already been done, Telco's efforts will be increasingly directed towards providing vehicles so equipped as to make long-distance driving far more comfortable and safe. The new heavy vehicle, for instance, will be supplied with dual-circuit braking systems, power steering, anti-roll bars, synchromesh gears and a cab which has been designed to international standards of visibility, comfort, noise level and ventilation.

Fuel Economy

17. Fuel economy is a major area of concern today in the Automobile Industry because of the inevitable increase in fuel prices. Your Company's Research section is paying considerable attention to this area. We are setting up capacity for the production of turbochargers which will be progressively fitted on our range of engines. Turbochargers have now been developed to such an extent that they constitute the most cost-effective means of not only producing increased horsepower, but of securing much better fuel economy. They also contribute substantially to reducing smoke and noise.

Exports

18. In the automobile field your Company maintains a commanding position as the largest exporter. During the year our exports amounted to as much as Rs 38 crores and we are confident of steadily improving upon this performance. Our joint venture for the assembly of vehicles in Malaysia is operating successfully and we now enjoy a fair share of the Malaysian market in the face of competition from established international companies. More such projects are being planned.

Public Service

19. Telco has grown in service to the nation. It grew essentially because it was built to provide what the people wanted, namely, good products with the lowest life cycle costs. Today the Company employs over 30,000 people and produces the largest number of commercial vehicles-up-till now it has produced well over 4,00,000 vehicles. It has brought into existence over 1,00,000 entrepreneurs owning 1 to 3 Telco trucks who, as I have already stated, generate enormous revenues for the Exchequer every year. Every vehicle that Telco sells creates jobs for about 12 people. Thus, 3 to 4 lakhs of new jobs are created year after year. If I may be permitted to say so, Telco has served the public well and the public has a high regard for your Company.

20. Such an asset has a right to the nation's savings for meeting future investment and working capital needs and it is indeed most gratifying that such resources have always been readily available to your Company.

Conclusion

21. The work of our staff has grown on account of our increased activities and has become far more complicated due to the prevailing national state of industrial unrest and the power famine. It would be only too easy to take for granted the efficiency with which our smooth-running machine has handled this increase but that would be wrong. It is the skill, the interest and the enthusiasm of our employees which have kept us in the forefront of our Industry and, on behalf of the shareholders and the Directors, I would like to express to all our employees our sincere thanks for an excellent year's work.

Note: **This does not purport to be a record of the proceedings of the Annual General Meeting.**

Rural Female Labour and Economic Development

S D Sawant

Ritu Dewan

The assumption that the benefits of economic development are equally shared by both men and women is disputable, particularly with regard to the rural population.

This paper, based on a study of a sample of 150 villages in two talukas of Thane district in Maharashtra, attempts to examine the impact of economic development on rural women, particularly on their employment. Its findings are that a progressive reduction in the size of female work-force, together with a widening male-female wage differential, appears to be an inescapable part of such development as the country has been having. While the problem of declining size of female work-force in rural areas is inevitably linked with the general problem of increasing unemployment, female workers are worse sufferers in this respect than male workers.

I
Introduction

THE process of development is a complex one inducing changes in several socio-economic and demographic aspects. Generally, the planners and the policy-makers conceive and execute rural development with the implicit assumption that their impact will be homogeneous on the lives of both males and females. However their presumption of equal sharing of benefits of development by both the sexes is disputable. Usually, the females in rural areas perform multiple duties by combining all types of household work including child-care with such other jobs as farming, animal husbandry, work in household industry etc depending upon the opportunities offered by the complex social, economic and organisational structure of rural life. How do these established patterns react and change in the process of development? Does the process of development strengthen, maintain or weaken the importance of the role of women in society? Does it adversely affect the prevailing role of females thereby aggravating inequality between the two sexes? These questions will have a crucial bearing on the social and economic status of women in future as the forces of development get intensified.

II
Approach and Data

Our aim in the present paper is limited. We have observed comparative changes in the selected macro indicators of rural life in order to examine the degree of integration of rural women in the process of development. Two approaches are feasible in this context. Either we study the history of a developed region for a long span of time, or we can make a comparative study of several socio-economic features of rural life in a number of (cross-sectional) regional units which represent varying degrees of development. The analysis undertaken here combines both the approaches. It is based on a cross-sectional sample of 150 villages from two talukas — 90 from Palghar and 60 from Jawhar — of the Thane district in Maharashtra. Two sets of data were available. We had information regarding various economic and demographic aspects of the villages covering work participation rates, literacy rates, resource position, productivity of land, techniques of agricultural production, availability of public utilities, etc. The information was collected through village schedules using Primary Census Abstract for 1961 and 1971, village records and through group discussions with the villagers and village administrators. From among these villages five and two villages were selected in the second stage from Palghar and Jawhar talukas respectively to collect the information for the year 1975-76 from the selected sample households through personal interviews. The second stage sample thus covered 300 households from Palghar and 150 households from Jawhar.[1] We draw upon both these data to study the participation of females in relation to males in the process of development.

Between the two talukas selected for study, Jawhar taluka is situated in a predominantly tribal and under-developed tract, whereas Palghar taluka is placed favourably with respect to infrastructural facilities and growth of commercial agriculture. Thus, the selected villages from Palghar taluka are relatively more developed than those from Jawhar taluka. However, the sample villages within the talukas are not homogeneous with respect to the degree of development. Thus, a sample of 150 villages constitutes a cross-sectional sample of underdeveloped, moderately developed and highly developed villages. The availability of detailed census data for the sample villages at two points of time (1961 and 1971) also facilitated the inter-temporal comparison of the villages. Among the seven sample villages — Nagzari, Wasare, Ambadi, Kelwa, Umroli from Palghar taluka, and Jamsar and Winwal from Jawhar taluka — the first three are moderately developed, the next two are highly developed while the last two (from Jawhar) are underdeveloped. Household level information collected for these villages for the year 1975-76 has also been analysed to study the association between the degree of development and other demographic and economic characteristics. Comparison among them seems to be quite interesting and revealing (See Table 1). Section III presents a comparative analysis of the characteristics of seven sample villages based on the household data reproduced in Table 2. Section IV examines the association among the various village characteristics through zero-order correlations computed by using the data for 150 villages, collected through village schedules. Section V scrutinises female literacy data (1975-

76) for the two developed villages from Palghar Section VI presents the conclusions of the study.

III

Characteristics of Selected Villages

The average productivity of paddy lands is distinctly higher in the two developed villages of Palghar (Kelwa and Umroli) and it is on the medium range for the other three villages (Nagzari, Wasare and Ambadi). Between the two villages of Jawhar, namely, Jamsar and Winwal, the latter shows poorest yield but the former has an yield comparable to that of the moderately developed villages of Palghar (Table 1, variable 24). The differential productivity seems to be due to the differential soil fertility (for average value of land owned, refer Table 1, variable 26), and irrigation, as well as due to higher use of modern inputs such as high-yielding varieties (HYVs) of crops, fertilisers, etc (Table 2 variables 35 and 36 for extent of use of HYVs and fertilisers) Further, although the parameters of the land and asset distribution (Table 1 variables 25 to 33) do not indicate extreme concentration of ownership at the upper end and crowding at the bottom in the developed villages in comparison with the moderately developed and underdeveloped villages, the average size of holding is lower in the developed villages of Palghar than that in the underdeveloped villages of Jawhar But the value of land owned and hence of the assets owned is higher in the developed villages of Palghar, which is an indication of higher productivity of land. Greater productivity of land seems to be the combined result of greater fertility of soil, relatively higher percentage of irrigated lands, higher use of fertilisers and HYVs and also of higher percentage of commercial crops. The distance of the village from the nearest railway station and from the nearest state transport bus stop also supports this view regarding the level of development in the sample villages (Table 2, variables 39 and 40).

The sex ratios were found to be favourable to females in 1961 in all the villages of Palghar with the exception of Kelwa where it was 975 right from the year 1961. (Table 2, variable 4.) Surprisingly, in Winwal and Jamsar, the two underdeveloped villa

Notes: (i) The coefficients less than 0.150 have not been reported above.
(ii) The r-value which exceeds 0.164 or 0.194 or 0.254 or 0.321 is statistically significant at 10 or 5 or 1 or 0.1 per cent level of significance, respectively.

ges of Jawhar taluka, females per 1000 males were 954 and 967 respectively in 1961. The ratios for 1971 show exactly a reverse trend. The sex ratios for all the villages of Palghar, again with the exception of Kelwa, declined during the sixties (Table 2, variable 13). Thus, the sex ratios have changed in favour of males in all the villages of Palghar with the exception of Wasare where it declined from 1,032 in 1961 to 1,003 in 1971. In Umroli, one of the two highly developed villages of Palghar, the sex ratio dropped steeply from 1081 to 950. In Kelwa, also highly developed, the ratio was unfavourable to females (975) and remained more or less unchanged (984). But Winwal and Jamsar underwent a contrasting change in the sixties. For 1961 the values of sex ratio were 954 and 967 but they changed to 1,004 and 1,029 in 1971 respectively. The observed changes seem to have been induced by in-migration of males to the developed areas in search of jobs and due to out-migration of males from the underdeveloped areas.

The male-female wage differential is crucial to determine whether the benefits of development have been equally shared by the two sexes. It is the highest in Umroli, but the lowest in underdeveloped Winwal. The wage rates for males and females are almost equal in both Jamsar and Winwal but they substantially differ in the developed villages of Palghar (Table 1, variables 1 to 3).[3] Work participation rate is also one of the most important indicators of participation of females in the process of development. The work participation rates for both the age groups of males and females (6 to 14 years and 15 years and above) are in general lower in the developed villages. They are higher for both males and females in the underdeveloped villages, but lie in between the two extremes for the moderately developed villages of Palghar (Table 1, variables 4 to 9).

TABLE 4 : FEMALE LITERACY IN UMROLI VILLAGE, 1975-76 (BASED ON HOUSEHOLD SAMPLE)

Category of households	Age group	Literacy levels					Total
		Illiterates	Literates	Primary education	Secondary education	College/ Technical education	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Landless labourers	6-14 years	46.15 (100.00)	— (–)	46.15 (25.00)	7.70 (10.00)	— (–)	100.00 (–)
	Above 14 years	34.62 (27.27)	26.92 (58.33)	23.08 (21.43)	15.38 (12.50)	- (–)	100.00 (–)

	Above 14 years	14.29 (6.06)	14.29 (16.67)	35.71 (17.86)	35.71 (15.62)	— (–)	100.00 (–)
Engaged in non-farming occupations	6-14 years	— (–)	— (–)	75.00 (12.50)	25.00 (10.00)	— (–)	100.00 (–)
	Above 14 years	57.14 (12.12)	— ( )	14.29 (3.57)	28.57 (6.25)	— (–)	100.00 (–)
Total	6-14 years	— (100.00)	— (100.00)	— (100.00)	— (100.00)	— ( )	— (–)
	Above 14 years	— (100.00)	— (100.00)	— (100.00)	— (100.00)	— (100.00)	— (–)

Notes: (i) Figures in parentheses give the percentages of females, with a given literacy level, over different categories of households.
(ii) Small farmers owning land upto 2 acres, medium farmers . owning land from 3 to 5 acres; Big farmers : owning more than 5 acres
(iii) There are no large farmers owning more than 25 acres

However, females' participation has been reduced in the developed villages more disproportionately than that of males. This is clear from the difference in the male-female participation rate in the least developed villages which is about 2 to 3 percentage points whereas it is 7 to 10 percentage points in the developed villages of Umroli and Kelwa It is noteworthy that work participation of girls is higher than that of boys in the underdeveloped villages, this tendency has been reversed in the developed villages. Later on, we shall see that this phenomena is reflected more prominently in improvement of literacy of women in the age group of 6 to 14 years. Thus opportunities of employment for females seem to have been reduced or their access to labour market seems to have become more difficult in the developed regions Further, the average annual employment is uniformly — though not substantially — less for females in all the villages irrespective of the level of development of the region (Table 1 variables 10 and 11) Thus decline in women's work participation rate together with their lower average annual employment suggests progressive deterioration in their economic status

The conclusions reached above are not based on the data borrowed from the Census of 1971, which is believed to have "grossly underestimated the number of women workers because of its emphasis on counting 'main' or primary workers".[3] Instead, the data for sample households collected through personal interviews have been used. Thus, it is noteworthy that the data drawn from an independent source also support the conclusion of declining work participation of women suggested by several recent studies on women's employment However, we shall also examine, additionally, the inter-temporal change in females' work participation rate in the sample villages as estimated through the data from the Census of 1961 and 1971 The variable 28 in Table 2 gives the percentage change in women's work participation rate between the last two Census years. Negative changes obtained for all the sample villages, except one, indicate almost universal withdrawal of females from the work force This may be the result of the so-called underestimation of the number of women workers in the Census of 1971 However, it is interesting to note that the villages which assume the first two ranks in the magnitude of decline are highly developed villages of Palghar — Kelwa having −50 13 per cent change and Umroli with −31 92 per cent change in work participation rate of females. There is no logical reason to assume that the extent of underestimation should be higher in the developed villages than that in the under-developed villages. Hence, a more severe decline in the developed villages logically indicates inverse association between the degree of development and the extent of females' work participation.

If we put together the above findings of widening male-female wage differential and of declining size of female labour force in the developed areas, the obvious conclusion that emerges is of worsening economic status of women with the process of development. To that extent their social status is also likely to suffer It is difficult to identify, with the limited available statistics used in this paper, the forces — social, cultural or otherwise — inducing increased withdrawal of women from the labour force. However, a gradual erosion in the economic independence of females, a socially undesirable consequence of development, seems to be undisputable. Whether it would be slowed down and ultimately halted, at least in the long run, by improvement in the literacy status of women is also doubtful. This is obvious from the fact that there has been de-

TABLE 5 : FEMALE LITERACY IN KELWA VILLAGE, 1975-76, (BASED ON HOUSEHOLD SAMPLE)

Category of households	Age group	Literacy levels					Total
		Illiterates	Literates	Primary education	Secondary education	College/ Technical education

(iii) There are no large farmers owning more than 25 acres.

duction in work participation rates of females in the developed villages despite the substantially higher rates of literacy of women (*variables 16 to 23,* Table 1). The crude literacy rates for females are as high as about 90 for the age group of 6 to 14 years and about 70 for adult females.[4] However, even such high rates of literacy have failed to maintain the women's share in employment. This may be the result of increased size of male labour force and technological displacement of female labourers in the developed regions, and the fact that improvement in female literacy is confined mainly to the upper classes of rural society — in which case the women's rates of work participation are substantially lower irrespective of the level of development. The first factor — increase in the supply of male labour in the rural labour market — was already active in the developed villages of Palghar (variables 23, 24 and 27, 28, Table 2). However, we have no data to examine the evidence of technological displacement of female labourers in the developed villages. We shall later verify the existence of the third factor (in section V) by scrutinising the literacy data for females in the sample villages.

Women's access to the labour market, *in general, depends upon the* volume of jobs available and also on the numerical dominance of male claimants for the jobs. Per capita net sown area represents a good indicator of the potential supply of jobs in the rural area. However, the size of male labour force which represents the demand aspect should not be ignored. Therefore, we choose per capita net sown area and per male worker net sown area as indicators of potentiality of the degree of access of females to the labour market. Figures presented in Table 2 (variables 31 and 32) indicate reduced opportunities for females in the agricultural sector of the developed villages. Lower per capita net sown area and per male worker net sown area in the developed regions may be the result of increase in population and greater inmigration of people of the developed areas in search of agricultural and other jobs. These forces restrict the scope for entry of women into the labour market. The situation is further aggravated by progressive reduction in self-employed workers, especially in the developed villages of Kelwa and Umroli, to the extent that it also narrows down the scope for *female members of the cultivating* households as well as of the households engaged in household industry to combine household duties with farming or household industry (Table 2, variable 29).[5] Variable 12 from Table 2 clearly shows that nearly half of the self-employed workers were women workers in 1961. In 1971 not only the percentage of total self-employed workers came down (Table 2, variable 20) but the women's share in self-employment also dropped (Table 2, variable 21), thus introducing a progressive decline in the number of self-employed women workers.

The nature of the household duties of women such as cooking, child-care, etc. is such that there is a restricted scope to combine them especially with regular employment on wages, which may not hold necessarily in the case of self-employment. It is difficult to estimate the work-load of such household duties of females, in terms of hours spent per day, in order to make a comparison between the developed and underdeveloped areas. However, we have made an attempt by calculat-

APPENDIX

VARIABLES INCLUDED IN CORRELATION MATRIX

No	Description
(1)	Male wage rate (1975-76) (Rs).
(2)	Female wage rate (1975-76) (Rs).
(3)	Difference between male and female wage rate (1975-76) (Rs).
(4)	Percentage of literacy-males, 1961.
(5)	Percentage of literacy-females, 1961.
(6)	Work participation rate-males, 1961.
(7)	Work participation rate-females, 1961.
(8)	Percentage of agricultural labourers to workers, 1961.
(9)	Percentage of self-employed male workers, 1961.
(10)	Percentage of literacy-males, 1971.
(11)	Percentage of literacy-females, 1971.
(12)	Work participation rate-males, 1971.
(13)	Work participation rate-females, 1971.
(14)	Percentage of agricultural labourers to workers, 1971.
(15)	Percentage of self-employed male workers, 1971.
(16)	Total population, 1971.
(17)	Percentage change in 1971 over 1961 in male population.
(18)	Percentage change in 1971 over 1961 in female population.
(19)	Percentage change in 1971 over 1961 in male literacy.
(20)	Percentage change in 1971 over 1961 in female literacy.
(21)	Percentage change in 1971 over 1961 in work participation rate of males.
(22)	Percentage change in 1971 over 1961 in work participation rate of females.
(23)	Percentage change in 1971 over 1961 in extent of self employed male workers.
(24)	Per capita net sown area, 1975-76.
(25)	Net sown area per male worker, 1975-76.
(26)	Percentage of area reported to be under crops, 1975-76.
(27)	Percentage of area under non-foodgrains, 1975-76.
(28)	Percentage of area under non-foodgrains and other crops not reported, 1975-76
(29)	Percentage of irrigated areas, 1975-76.
(30)	Percentage of area under HYV paddy to total paddy, 1975-76.
(31)	Percentage of area under fertilisers to gross sown area, 1975-76.
(32)	Quantity of nutrients (N+P+K) used per acre of area reported to be under crops (kg), 1975-76.
(33)	Quantity of nutrients used per acre of area under fertilisers (kg), 1975-76.
(34)	Average yield of paddy per acre (kg), 1975-76.
(35)	Distance in kilometres from the nearest railway station.
(36)	Distance in kilometre from the nearest state transport bus stop.

ing the number of children upto the age of 5 years per 100 females including females with age more than 5 years,[6] and per 100 females with age 15 years and above. Surprisingly, this ratio is lower in the developed villages where female participation in work is also lower (Table 1, variables 12 and 13).[7] Thus the lower ratio of work participation is not, at least, the result of higher burden of child-care on females in the developed *versus* underdeveloped villages

We can also observe the inter-temporal change in the demographic characteristics of the sample villages during the decade of 1961 to 1971 (Table 2, variables 23 to 29). The most heartening revelation comes from the variable improvement in female literacy. The percentage change in crude literacy rate for females surpasses that of male literacy by about 3 to 6 times (Table 2, variables 19 and 20). Surprisingly, the literacy rates for girls and boys of the age 6 to 14 years are very high and close to each other in the developed villages of Kelwa and Umroli; but not so in the case of either the moderately developed or the underdeveloped villages. If this trend continues the initial difference between the literacy rates of males and females may be slowly wiped out. Can we then expect the declining trend in the females' rate of work participation to get reversed, through substantial improvement in literacy, at least in the long run? This may materialise only if, among other factors, the improved general literacy in females promotes necessary skills to enable them to participate in work in the changing conditions of improved techniques of production both in agriculture and in other sectors. However, if these hopes are belied, the continuing trend of deterioration in the economic status of women will expose them to even greater economic and social discrimination and exploitation.

IV

Implications of Correlation Analysis

Let us now analyse the association among the different village characteristics (described in Appendix), based on data collected through village schedules, as reflected through the zero-order correlations to find out whether they are consistent with the findings of the preceding section. We summarise the results by representing the correlations, i e, r-values which exceed numerically the value 0.150, of some of the key variables in Table 3.

All the variables which indicate the existence of development or represent the forces strengthening development have positive associations among themselves. For example, average yield of paddy is positively associated with literacy rates (0.466, 0.462), wage rate of males (0.274), size of village (0.311), extent of area under non-foodgrains (0.228) and negatively associated with variables such as area under subsistence crops (—0.160) and distance from the nearest railway station (—0.483). Variables like the percentage of area under HYV, of area under fertilisers, etc, are, however, not significantly associated with average yield of paddy mainly due to gaps in the observations of these variables for some villages.

Variable X_{11} and X_{13}, i e, literacy rate and work participation rate of females in 1971, are crucial for determining the economic independence and thereby the females' share in the benefits of development. The rate of female literacy is directly and significantly associated with variables indicating development like male literacy (0.897), size of village (0.341), the percentage of area under non-foodgrains (0.212), of area under fertilisers (0.192), per acre dose of fertilisers used (0.192) and average yield of paddy (0.462). It is negatively associated with the work participation rate for female (—0.174), the percentage of self-employed workers (—0.236), per capita net sown area (—0.165), area under subsistence crops (—0.185) and distance from the nearest railway station (—0.496). Thus female literacy is directly associated with indicators of development but inversely associated with the subsistence character of traditional agriculture.

The work participation rate of females has positive correlation with the percentage of agricultural labourers (0.271), males' work participation rate (0.326), per capita net sown area (0.192), but has negative association with size of village (—0.224), the percentage change in male population (—0.169), i e, factors representing the composition of rural labour market or indicating changes in the demand and supply of labour respectively. But the

change in the work participation rate of females between 1961 and 1971 is directly associated with the females' rate of participation in 1971 (0.386) and change in males' participation rate (0.178). The latter two variables represent the subsistence character of agriculture. Higher/lower work participation rate of females in 1971, thus, seems to be the result of higher/lower change in their work participation rate between 1961 and 1971. In other words, the work participation rates of females were relatively lower in the developed villages than in the underdeveloped villages right from 1961. The change in the females' work participation rate has also a negative relationship (—0.163) with variable 35, namely, distance from the nearest railway station, which implies that larger distances are associated with lower positive or with negative changes in the females' work participation rates.

The percentage of self-employed workers in the rural area indicates the degree of subsistence in agriculture as most of the self-employed workers are cultivators. This variable (for 1971) holds inverse relationship with the literacy rates of males and females (—0.235 and —0.236), the percentage of agricultural labourers in total workers (—0.429), and size of village (—0.232). It is also negatively associated with the females' work participation rate and the average yield of paddy but the r-values are not statistically significant. It has positive association with per capita net sown area and per male worker net sown area (0.421 and 0.397), i e, those characteristics indicating higher supply potential of jobs in agriculture. The positive correlation of percentage of self-employed workers with the percentage change in the same variable during the decade of 1961 to 1971 (0.221) has also an interesting implication. It suggests that the higher percentage of self-employed workers in 1971 is directly associated with positive and relatively greater changes in the extent of self-employed workers during the last decade. It also means that the lower percentages of self-employed workers in 1961 are associated with either the lower positive changes or negative changes in them in the last decade and have, thus, resulted in still lower rates of self-employed workers in 1971 in developed regions.

The variable 3, namely, the difference between the male and female wage rates, has no significant association with any one of the 36 variables (listed in Appendix) except its obvious correlation with that of female wage rate (—0.812). Absence of association is likely to be due to the arbitrary nature of the wage statistics reported by the village administrators. The averages of the actual wage rates received by the members of the sample households would have been much more reliable in this context but they were available only for six sample villages of Palghar and Jawhar and not for the remaining 144 villages.

Thus, the preceding discussion confirms our earlier impression of declining economic participation of women in the developed areas; but the conclusion of widening male-female wage differential could not be reasserted through correlation analysis, due to unreliability of the reported village level wage statistics.

The variable X_{40}, namely, the change in female literacy during the sixties, is also one of the crucial variables vitally affecting economic and social status of women. Earlier, we mentioned the existence of positive and significant association of female literacy rate (1971) with the development indicators. But its inter-temporal change represented by X_{40} fails to show up statistically significant association with any of the other village characteristics and thus does not positively support the conclusion of gradual disappearance of difference between male and female literacy. However, it should be remembered that this conclusion reached in the previous section was established by using age-specific female literacy rates in 1975-76 observed for seven sample villages and it was also reaffirmed by the rates of improvement in female literacy between 1961 and 1971. Hence, we feel that this point needs to be analysed further to identify the classes of women who benefited more by improved literacy, particularly in the developed villages.

V

Female Literacy in Developed Villages

As noted above there is substantial improvement in female literacy in the developed villages of Palghar taluka. We now examine whether this improvement is uniformly distributed over the different classes of rural society or is confined mainly to the previleged classes. Such an examination is crucial for understanding the long-term trends in the females' work participation rates. Improved literacy can play a decisive role in reversing the declining trend of females' participation in economic activity only when the literacy level of female members of the lower classes of the society is also raised.

Tables 4 and 5 deal with the literacy levels of females, of different categories of households, separately for two age groups, in Umroli and Kelwa respectively. The households are classified in five categories. The first four categories are based on ownership of land. They are landless labourers, small farmers, medium farmers and big farmers. The fifth category is of households with non-farming occupations. The percentages shown in the parentheses under column (3) in Tables 4 and 5 clearly indicate that almost all illiterate girls belong to the landless households. However, the distribution of literates, i e, those without any formal education, and also of the girls engaged in primary education (Column 5) and in secondary education (Column 6) is relatively more even over the different land-owning classes in rural area. This observation reflects in the analysis carried out to test the independence of two attributes, namely, literacy and land-owning classification of households. For the age group, 6-14 years, the calculated X^2 (chi-square) values for Kelwa and Umroli are 13.78 and 15.86, both statistically non-significant even at 10 per cent level of probability.[8] Thus, the extent of landownership does not have a significant impact on improvement in the literacy status of the girls. This is an important conclusion, as it implies that the educational facilities are not so unevenly distributed as to bypass totally the females from the lower income classes. However, this does not necessarily mean that the average literacy level of different groups is almost equal. In fact, the literacy scores for girls work out to be 2.04, 2.60, 2.88, 3.0, 2.82 and 1.23, 2.67, 3.00, 2.67, 2.50 from the five categories of households in Kelwa and Umroli respectively.[9] Moreover, it may happen that the ratio of drop-outs to the total after completion of secondary education will be higher for females in the lower income classes and, hence, the average level of literacy for adult females may become progressively lower for the lower income classes of rural society.

Row-wise percentages in Tables 4 and 5 represent the distribution of females over the different levels of literacy. The percentage of females

engaged in secondary and college or higher education varies from 29 per cent in the landless households to 68 per cent in households owning big farms in Kelwa and from 15.38 per cent in the landless households to 47 per cent in households of medium farmers in the village Umroli. In fact, average literacy scores for females from five different categories of households work out to be 1.54, 2.45, 2.84, 3.68, 1.84, and 1.35, 2.11, 2.94, 2.29, 1.43 for Kelwa and Umroli respectively. This uneven sharing of education facilities has been confirmed by the computed values of X^2 which are 33.94 and 33.04 for Kelwa and Umroli respectively. They are statistically significant at 5 per cent level of probability and thus support the dependence between literacy status of adult females and the landownership classification of households. In other words, improvement in the literacy of adult females is not uniformly distributed over all the classes of the rural society but is mainly confined to the upper classes.

VI

Conclusions

The fact that clearly emerges from the discussion in the previous three sections is that declining work participation, widening male-female wage differential and substantial improvement in female literacy are associated with the forces of development. Thus, a progressive reduction in the size of female work force together with widening male-female wage differential indicates a gloomy forecast of deterioration in the economic status of women. Even substantial improvement in the literacy level of adult females would not help decisively in reversing this trend. This conclusion seems to be inevitable in view of the fact that the observed improvement in the literacy level of adult females is at present mainly confined to the upper classes of the rural society whereas most of the female lobourers belong to the lower classes. Moreover, whatever little improvement in the literacy level of females from the lower classes has materialised does not seem to have resulted in increased job-skills and hence better competence of women to survive in the labour market. It is true that this problem of declining size of female work force is inevitably linked up with the general problem of increasing unemployment. However, it cannot be denied, in view of the analysis presented in this paper, that the females are worse sufferers than males.

We, therefore, tentatively conclude that conscious efforts for training of female work force in the rural areas may be one factor to help halt the process of their displacement from the traditional sectors of employment and restore their active participation in economically productive activities. To achieve this, planning of development programmes in the country needs to be reoriented. An inevitable consequence of total absence of such policy measures would be a progressive erosion in the productive roles of women, ultimately leading them to an even more inferior status in society.

Notes

1 These data were collected under the scheme, 'Integrated Rural Development', undertaken jointly by the Department of Economics, University of Bombay and the Directorate of Economics and Statistics, Government of Maharashtra.

2 To examine the variations in the male-female wage differential for the sample villages, we make use of variable 3 from Table 1 and not from Table 2 because the wage statistics, recorded in village schedules was reported by the village administrators and was found to be arbitrary. Therefore, the averages of wage rates computed by using wages actually received by the members of the sample households were preferred to former wage statistics.

3 "Draft Five Year Plan, 1978-83", Planning Commission, Government of India, 1978, p 85.

4 The crude literacy rates presented in Table 1 for the seven sample villages are considerably higher than those shown in Table 2. This divergence is mainly due to the following reasons: (i) The literacy rates calculated on the basis of household data are the age specific literacy rates and exclude children upto the age of 5 years. (ii) They are for the year 1975-76, whereas the latter figures shown in Appendix 2 are based on Population Census, 1971.

5 Considerations of social status may also prevent the female members of the household — formerly cultivating some land of their own or on lease — from accepting any employment on wages on others' fields.

6 The assumption is that girls in the age group of 6 to 14 years help their mothers by looking after their younger brothers/sisters.

7 Probably, the time spent per day in carrying water home, for domestic use, is also relatively less in the developed regions than in the underdeveloped villages.

8 The table values of X^2 for 12 degrees of freedom at 10 per cent and 5 per cent level of significance are 18.55 and 21.93 respectively.

9 This is just an illustrative calculation to indicate the relative position of different categories of households, in terms of female literacy. The average scores are calculated by assigning the scores of 0, 1, 2, 4 and 8 to five literacy groups, namely illiterates, literates, engaged in primary education, secondary education and college or higher technical education respectively.

Commissioner for Scheduled Ca[illegible]s and Scheduled Tribes

P A James

G Sreenivas Reddy

The Commissioner for Scheduled Castes and Scheduled Tribes is charged with investigating the implementation of measures intended to safeguard the interests of the Scheduled Castes and Scheduled Tribes.

However, both the official status accorded to him as well as the facilities and personnel made available to him are by no means on par with the nature of his responsibility.

As a result, over the years, the effectiveness and usefulness of this officer have been eroded. This paper attempts to assess the functioning of the Commissioner and to suggest arrangements for improving his effectiveness.

THE office of the Commissioner for Scheduled Castes and Scheduled Tribes (CSCST) belongs to the special type of authorities mentioned in the Indian Constitution — such as the Election Commission, the Union Public Service Commission (UPSC), the Controller and Auditor General of India (C and AG) Just as the Election Commission has been set up to ensure free and fair elections, the UPSC to recruit impartial and efficient civil service, and the C and AC to maintain financial propriety in the transactions of the Centre and the states, so the Commissioner for Scheduled Castes and Scheduled Tribes is expected to safeguard the interest of the Scheduled Castes and Scheduled Tribes.

The Scheduled Castes (SCs)[1] and Scheduled Tribes (STs)[2] have been victims of discrimination and exploitation for centuries. Numbering 123 7 million they constitute 22 59 per cent of the country's population (1971 Census)[3] The Constitution of India contains a number of special provisions[4] for their upliftment. These provisions[5] have been strengthened by the passage of Central and state legislation,[6] and also through a number of statutory orders. In addition to prohibiting various forms of discrimination, they secure to SCs and STs reservations in the legislative bodies, educational institutions, and public services, and offer them economic assistance.

A look into the working of the office of the CSCST is timely as it stands at the cross-roads, awaiting a major transformation following the 46th Amendment Bill to the Constitution.[7] An attempt is made in this paper to examine the working of this office[8] and to assess its role in the redressal of injustice done to SCs and STs

Status, Powers and Functions of Commissioner

Generally known as the Commissioner for Scheduled Castes and Scheduled Tribes, but mentioned in the Constitution as 'Special Officer', the Commissioner is appointed by the President of India He has to investigate the implementation of measures intended to safeguard the interests of SCs and STs and report to the President about the same The President is required to see that such reports are placed on the table of each House of Parliament

The first Commissioner for Scheduled Castes and Scheduled Tribes (CSCST) was appointed on November 18 1950[9] The status of a Secretary[10] of a Ministry of the Government of India, accorded to him, is not on par with the nature of his office Th first Commissioner raised the question of independent status for the office from the very beginning[11] The Elayaperumal Committee,[12] the Study Team on the Welfare of Backward Classes (1959), the Estimates Committee (Second Lok Sabha, 49th report, 1958-59)[13] have all recommended an independent status to the Commissioner's organisation But the minister concerned asserted that the Commissioner was just an Officer of his Ministry[14]

The Constitution is silent about the status of the Commissioner and, taking advantage of this, the government has grabbed the discretion to subordinate the CSCST to itself.

During the course of its working, the government has saddled the Commissioner with a number of non-statutory functions and made him subordinate to the concerned Ministry in respect of such functions[15] He had been excluded from the co-ordinating committees and was not being associated with the policy decisions of the government in regard to the welfare of SCs and STs[16]

The Constitution does not specify that his recommendations are binding on the government. Consequently, the Commissioner has become powerless even to collect the basic data[17] required to fulfil his duties "His annual reports are a record of his bewailings and beseechings year after year"[18] The Elayaperumal Committee wanted the Commissioner's powers to be clearly defined, responsibilities and jurisdiction fixed so that he could function effectively[19]

Headquarters Organisation

The office of the CSCST consists of the Commissioner,[20] two Deputy Commissioners, and ot[illegible] clerical staff — totalling about 70 members in all[21] (as on January 1979) The office and clerical staff are drawn from the Home Ministry and the Central Secretarial Service They are transferrable to any other office of the Government of India. Only the research and investigatory staff are recruited exclusively for the Commissioner's Office.

The Commissioner is subject to two major constraints regarding his office First, he does not have adequate staff to cope with the demands of his job Secondly, he has no freedom in staffing his organisation.[22]

31	Pondicherry	4 72	0 73	15 50	— No STs—	
	Total	54 82 crores	8 25 crores	15 5	4.12 crores	7.5

Note *The latest population of the SCs and STs is based on the Scheduled Castes and Scheduled Tribes Orders (Amendment) Act, 1976.

This has led to a number of disastrous consequences for the Commissioner's functioning. Nearly two-thirds of the year has been spent by the Commissioner and his men on report writing to meet constitutional obligation.[23] They are thus left with just four months to do the more important tasks of collecting information, disposing of complaints, etc. Indeed, the report has become an end in itself, rather than a means to focus on problems of backward communities.

The Commissioner, as a constitutional authority, should have a full say in matters of staffing and finances. This can be done perhaps by making the expenditure on the Commissioner's Office chargeable to the Consolidated Fund of India and non-votable — as in the case of the Judiciary.

FIELD ORGANISATION

Till 1967, the Commissioner had 17 field offices operating under his direct control. Located in different parts of the country,[24] they played a useful role by enquiring into the implementation of constitutional safeguards and the complaints pertaining to atrocities against SCs and STs. In the field organisation, then, the Commissioner had a dependable instrument for assessing the conditions of these people.

In June 1967 the Commissioner's office was stripped of its field offices. Reorganised into Zonal Directorates of Backward Classes Welfare, the field offices were brought under the control of the Home Ministry[25] and no additional staff was provided. In this way, the Commissioner virtually lost his eyes and ears. He had to safeguard the interest of nearly 128 millions of people spread over an area of three million sq km with a meagre establishment of about 70. His scanty organisation failed to cope with the discharge of his constitutional obligations. To get a greater part of his work done, he was forced to depend on governmental agencies, which were not answerable to him.

Strong pleas were made from several quarters for the restoration of field offices. The Law Ministry of the Government of India felt that collection and assessment of data, entrusted to the Commissioner under Article 338 of the Constitution, could not be entrusted to any other authority not answerable to the Commissioner.[26] Members of Parliament, of all shades of opinion, were also critical of this.

The Parliamentary Committee on the welfare of SCs and STs, held that by abolishing the field organisation, the government has "denigrated the office, status, authority and capacity of the Commissioner, to discharge his constitutional obligations".[27] Several expert committees such as the Elayaperumal Committee,[28] the Shiloo Ao Committee,[29] have recommended restoration of the field offices. But all these pleas fell on deaf ears.

For some time, the government has designated the Zonal Directors-General

of Backward Classes Welfare (ZDBCWs) as ex-officio Deputy Commissioners for SCs and STs. But the ZDBCWs did not pay much attention to the assignments given by the CSCST.[30] Moreover, it is constitutionally improper[31] to force the Commissioner to depend on the executive machinery of the government.

There is a strong case for restoring the field organisation. The reasons are: First, in a vast country, such as India it is difficult for a single office to look into the problems of a huge clientele. Secondly, since India is a federal polity, the Commissioner has to deal with problems in both Central and state governments. In fact, the latter have greater responsibility in the execution of ameliorative measures. Thirdly, outsiders to the state find it difficult to reach tribal areas. A field office with the knowledge of local conditions can overcome this problem. Fourthly, each state has its own peculiar problems and most of the grievances and complaints are naturally written in local or regional languages. A field office with knowledge of local conditions and languages would be an appropriate agency to meet such situations.[32]

Disposal of Complaints

Every year, a large number of complaints are received in the Commissioner's office.[33] Due to inadequate staff, a number of them could not be attended to by study-cum-investigation teams. Further, the Commissioner has no police or enforcement powers to enquire adequately and take prompt action. He does not have the power to sub-poena witnesses and documents to carry out proper investigation into complaints. At best, he can refer the complaints to the appropriate authorities for necessary investigation.

The outcome of such reference may be any of the following :

(1) The complaint may be ignored; (2) Some action may be taken, but no report is sent to the Commissioner's office and hence the disposition of the case remains unknown; (3) Action is taken, but merely as a formality, and the case is not followed through to secure justice for the untouchables involved; (4) Action is begun, but delayed, until the case is lost in time; (5) The authorities use various forms of intimidation to persuade the untouchable to drop the case, (6) The complaint is investigated and effective action is taken on behalf of the untouchables.[84]

The first five ways of disposal outnumber the sixth.[85] Often, the Commissioner is not kept informed of the action taken regarding the complaints.[86] Replies to enquiries are either not received, or they are incomplete, or delayed until the case is forgotten.[87] Table 2 shows the disposal of cases reported to the police.

From the large number of cases pending in the courts of law it can be seen that a lot of delay is involved in their disposal. The number of cases pending has been rising steeply, particularly since 1971.

Acquittal of a large number of cases may be due to factors, such as insufficient evidence, inability of the victims to secure legal aid due to poverty, and fear of consequences of going to a court of law.[88] Bureaucracy — particularly the lower echelons — have little sympathy for these people.[89] Local and state officials, to whom complaints are referred, reflect the views of caste-Hindus and are influenced by their pressure, and hence often delay action and do nothing. They threaten the untouchables who have lodged complaints not to court trouble for themselves.[90]

The Reports

The reports attempt to present an overall review of the measures undertaken by the government — Central, state, and Union territories — for the welfare of SCs and STs. As such, they can help the legislature to evaluate the

[illegible] in the Office of the CSCST

Year	Murder	Rape	Burning	Beating	Untouchabilitiy	Others	Total
Jan-June-1974	114	127	320	637	601	959	2758
1975-76	49	13	13	604	44	—	723
1976-77	18	4	4	566	34	—	626

performance of executive and the executive government of their subordinate agencies. By pinpointing the faults of administration, they make parliament's scrutiny of welfare programmes for SCs and STs easier. The discussions of the reports in Parliament and state legislatures provide an opportunity to Parliamentarians to understand and review the problems of backward communities.

It is a sad thing to know the fate of the reports submitted by the Commissioner. Annually, only three or four state legislatures take up the reports for discussion. At times it takes years for these reports to come up for discussion in Parliament.[41] It would be difficult for Parliament. to hold any meaningful discussion on these outdated reports.

An Assessment

Though the Constitution is very brief about the functions of his Office, successive Commissioners have developed upon themselves a wider area of activity. In addition to the constitutionally envisaged functions, the CSCST is made an ex-officio member of the Scheduled Castes and Scheduled Tribes Commission.[42] With the fund of experience and information behind his office, the CSCST plays the role of an expert in the deliberations of the Commission.

The task of the Parliamentary Committee on SCs and STs[43] is greatly facilitated by the CSCST's Office. The reports of the Commissioner not only provide information but also give direction to the deliberations of the Committee. The CSCST's office has undertaken quite a few studies at the instance of the Committee.[44]

The Commissioner, to some extent, has served as a vehicle for ventilating the grievances of the Scheduled Castes and Scheduled Tribes, right up to the highest level of decision-making. Within the available limits of the staff and resources, he has taken up with the authorities concerned[45] a few grievances of a serious nature. His organisation has been serving as a clearing house of information on SCs and STs. The reports, through their overall perspective, can help the Central government to co-ordinate the policies and programmes of the state governments and Union territory administrations in relation to SCs and STs.

The Commissioner made innumerable recommendations for the amelioration of the SCs and STs. It is a different matter that a vast majority of them are put in cold storage.

Above all the Commissioner bears solid testimony to the stark reality, that 28 years of constitutional safeguards and three decades of Independence "are yet to bestow a willing smile on many a hamlet and slums of the SCs and STs. They continue to submit to the decrees of fate rather than reap the benefit of the decrees of our basic law. There are many places in the country where the SCs are denied even common sources of drinking water. The nation's resolve made with due solemnity to secure to all citizens 'Justice — Social, Economic...' has remained just a promise, honoured perhaps more in breach in the case of the SCs and STs".[46] The percentage of landless agricultural labourers among the SCs and STs is rising and cultivators decreasing (see Table 3) — thereby indicating the deteriorating economic conditions of these people.

Innumerable atrocities, such as rape, murder, burning, beating, etc, are still perpetrated on them. Table 4 gives the number of atrocities reported to the Commissioner's office in the recent years. However, this is only illustrative and not indicative of the gravity or magnitude of the problem.

Conclusion

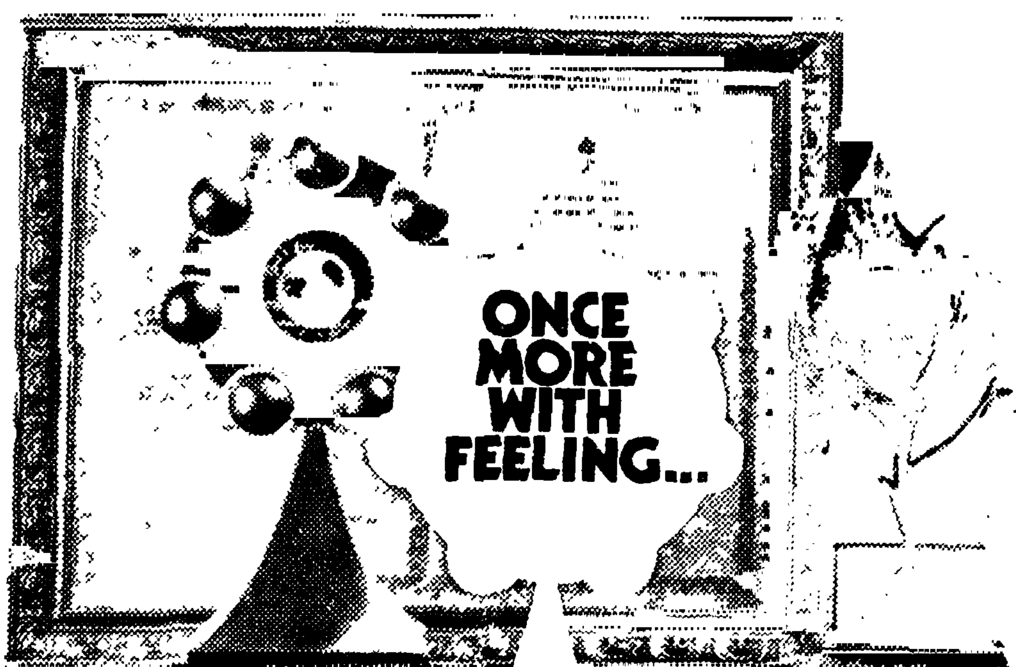
The CSCST's office, despite playing a useful role, had failed to come up to the expectations of the founding fathers of the Constitution. The Commissioner was not given the status commensurate with his responsibilities, was made to depend excessively on the government, and was starved of purse and personnel. Non-co-operative governmental agencies, entrenched caste feelings, and unsympathetic bureaucracy, have all operated as constraints in the effective functioning of the office.

The Commissioner's Office is a skeleton without flesh and blood. Given Lilliputian status, it had to grapple with Herculian tasks. Thus, the provision in the Constitution relating to the office of the CSCST is reduced to a fraud. There is need to take a fresh look at the office of the Commissioner to make its very existence meaningful.

Presently, the Commissioner's office is on the verge of a major reorganisation. The 46th Amendment Bill, introduced in the Lok Sabha recently (May 1979), has sought to amend Article 338 by replacing the special officer (CSCST) by a multi-member Scheduled Castes and Scheduled Tribes Commission. It could not be cleared in the Lok Sabha for want of special majority,[47] but is likely to come up in the next session of Parliament. The new legislation should take into account the deficiencies in the office and avoid the pitfalls. Unless this is done, the new Commission would be as futile and ineffective as the CSCST had been.

The constitutional machinery for SCs and STs must be strengthened on the following lines:

Appropriate status must be accorded to the Special Officer (CSCST). His headquarters office should be strengthened and field organisation restored. Expenditure on his office should be non-votable on the lines of the Judiciary. He should be empowered to summon witnessess by sub-poena to force presentation of records and to require testimony under oath. It may have to be a quasi-judicial body for the purpose.



Commissioner's cells need to be established at the state and Union territory levels to facilitate a smooth and ready flow of information from them to the Commissioner's Office.

Prompt discussion of reports in Parliament and state legislatures should be ensured. Setting up legislature committees on SCs and STs at the state level on the lines of parliamentary committee would be helpful for this purpose.[49]

Notes

1 The term 'Scheduled Castes' refers to the people belonging to ex-untouchable castes, popularly known as Harijans. They were earlier known as Panchams, exterior castes, etc. Considered by Hindus as defiling by their touch, they were required to undertake disagreeable occupations such as tanning, flaying, leather work, and scavenging.
